}	24		

### 2.3 • Möbius Function

```
int phi[X+20], mob[X+20], prr[X+20];
memset(mob, -1, sizeof(mob)); mob[1] = 1;
for (int x = 1; x <= X; x++){ phi[x] = x; }
for (int x = 2; x <= X; x++){
    if (prr[x] == 0){
        for (int a = x; a <= X; a+=x){ prr[a] = x; phi[a] -= phi[a]/x; }
    } int p = prr[x]; mob[x] = (x/p%p == 0 ? 0 : mob[x/p]*mob[p]);
}
```

### 2.4 • Miller-Rabin

```
const vector<ll> prr = {2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37};
bool prime(ll n){
    if (n <= 40){
        for (int p : prr){ if (n == p){ return 1; } }
        return 0;
    } if (n%2 == 0){ return 0; }
    int s = 0; ll d = n-1; while (d%2 == 0){ s += 1; d /= 2; }
    for (int p : prr){
        ll res = 1, mul = p, bit = d; while (bit){
            if (bit&1){ res = (i128)res*mul % n; }
            mul = (i128)mul*mul % n; bit >>= 1;
        }
        bool chk = (res == 1); for (int r = 0; r < s; r++){
            chk |= (res == n-1); res = (i128)res*res % n;
        } if (!chk){ return 0; }
    } return 1;
}
```

### 2.5 • Pollard's Rho

```
vector<ll> ans;
inline ll f(ll x, ll c, ll mod){ return ((i128)x*x + c) % mod; }
void factor(ll n){
    if (n == 1){ return; }
    if (n%2 == 0){ ans.push_back(2); return factor(n/2); }
    if (prime(n)){ ans.push_back(n); return; }
    uniform_int_distribution<ll> rnd(1, n);
    ll x1 = rnd(gen); ll x2 = x1;
    ll c = rnd(gen); do{
        x1 = f(x1, c, n); x2 = f(f(x2, c, n), c, n);
    } while (gcd(abs(x1-x2), n) == 1);
    ll g = gcd(abs(x1-x2), n);
    if (g == n){ return factor(n); }
    else{ factor(g); factor(n/g); }
}
```

### 2.6 • Power Tower

$CUT \geq \log_2 m$  is that  $a^{\phi(m)} \not\equiv 1 \pmod{m}$  can happen. But for  $d \geq \log_2 m$ ,  $a^{d+\phi(m)} \equiv a^d \pmod{m}$ .

```
const ll INF = 1e18; // INF > mod^2; might need i128
ll fpow(ll mul, ll bit, ll mod, ll lim = INF){
    ll res = 1; while (bit){
        if (bit&1){ res = min(res*mul, lim) % mod; }
        mul = mul*mul % mod; bit >>= 1;
    } return res;
}

const int CUT = 100, LEN = 4; // CUT >= log2(mod); A = [2 for 1..LEN] > CUT
```

```
int n; int arr[1000020];
int solve(int idx){
    int val = 1; for (int i = n; i >= idx; i--){ val = fpow(arr[i], val, (CUT+1)*(CUT+2), CUT+1); }
    return val;
}
int solve(int idx, int mod){
    if (mod == 1){ return 0; }
    if (idx == n){ return arr[idx] % mod; }
    if (n-idx+1 <= LEN){
        if (solve(idx+1) <= CUT){ return fpow(arr[idx], solve(idx+1), mod); }
    }
    int m = phi[mod];
    return fpow(arr[idx], solve(idx+1, m) + CUT*m, mod);
}
```

### 2.7 • Iterating Floor of k/n

```
vector<pl2> v; // saves {floor(k/n), # of k}.
ll sq = (ll)sqrt(n);
for (ll i = 1; i <= sq; i++){
    ll val = n/i; if (v.empty() || v.back().fr != val){ v.push_back({val, 1}); }
    else{ v.back().sc += 1; }
}
for (ll x = sq; x >= 1; x--){
    ll st = max(sq+1, n/(x+1)+1), ed = n/x;
    if (st <= ed){ v.push_back({x, ed-st+1}); }
}
```

## 3 Mathematics - Combinatorics

### 3.1 • Well-known Sequences

Let  $x^{(k)}$  be the product of  $x$  to  $x+k-1$ , and  $x_{(k)}$  be the product of  $x$  to  $x-k+1$ . Let  $C_{n,r} = \binom{n}{r}$  and  $H_{n,r} = \binom{n+r-1}{r}$ . Let  $P_{n,r} = n!/r!$ .

Derangement is the number of permutation with  $\pi_i \neq i$  for all  $i$ .

$D_0 = 1; D_1 = 0; D_n = (n-1)(D_{n-1} + D_{n-2})$ .

Catalan Number is the number of valid Regular Bracket Sequence with  $n$  pairs.

$C_0 = 1; C_{n+1} = (4n+2)C_n/(n+2)$ . Def:  $C_{n+1} = \sum_{k=0}^n C_k C_{n-k}$ .

Stirling Number of the First Kind is the number of permutation with  $n$  elements and  $k$  cycles.

$S_{0,0} = 1; S_{n,0} = S_{0,k} = 0; S_{n,k} = (n-1)S_{n-1,k} + S_{n-1,k-1}$ .

Stirling Number of the Second Kind is the number of ways to partition a set of  $n$  distinct objects onto  $k$  non-empty subsets.

$S_{0,0} = 1; S_{n,0} = S_{0,k} = 0; S_{n,k} = kS_{n-1,k} + S_{n-1,k-1}$ .

Bell Number is the number of ways to partition a set of  $n$  distinct objects.

$B_n = \sum_{k=0}^n S_{n,k} = \sum_{k=0}^n C_{n,k} B_k$ .

Partition Number is the number of ways to partition  $n$  nondistinct objects into collection of  $k$  non-empty bunches.

$p_{n,k} = p_{n-1,k-1} + p_{n-k,k}. p_n = \sum_{k=1}^n p_{n,k}$ .

### 3.2 • Well-known Formulas

- Lucas's Theorem:  $C_{n,r} \equiv C_n \pmod{p}, C_{m,r} \equiv C_m \pmod{p}$
- Vandermonde's Identity:  $\sum_{k=0}^r C_{n,k} C_{m,r-k} = C_{n+m,r}$ .
- Hockey-Stick Identity: Assuming  $n > r$ ,  $\sum_{k=r}^n C_{k,r} = C_{n+1,r+1}$ .
- $\sum_{k=r}^n C_{n,k} C_{k,r} = 2^{n-k}$ .
- $\sum_{k=1}^n C_{n,k} C_{c-1,k-1} = C_{2n-1,n-1}$ .
- $\sum_{k \leq n}^{k \text{ is odd}} C_{n,k} a^{n-k} b^k = ((a+b)^n - (a-b)^n)/2$ .
- $\sum_{k=0}^n C_{r,k} / C_{n,k} = C_{n+1,n-r+1} / C_{n,r}$ .

- Number of involutions:  $I_0 = I_1 = 1; I_n = I_{n-1} + (n-1)I_{n-2}$ .
- Number of permutations of size  $n$  where every cycles have length  $\leq k$ :  $T_{n,k} = n!$  if  $n \leq k$  else  $nT_{n-1,k} - (n-1)_{(k)}T_{n-k-1,k}$ .
- Catalan Number = Number of permutations of length  $n$  that avoids the pattern 123.
- Number of prefix RBS of length  $n+k$  with  $n$  opens and  $k$  closes:  $C_{n+k,k}(n-k+1)/(n+1)$ .
- Number of RBS of length  $2n$  with exactly  $k$  ')'s:  $C_{n,k}C_{n,k-1}/n$ .
- Stirling Number of the Second Kind but each subset's size  $\geq r$ :  
 $S_{r,n+1,k} = kS_{r,n,k} + C_{n,r-1}S_{r,n-r+1,k-1}$ .
- Stirling Number of the Second Kind but pairwise distance  $\geq d$ :  $S_{n-d+1,k-d+1}$ , assuming  $n \geq k \geq d$ .
- Burnside: Let  $G$  be a group.  $r = \sum_{g \in G} |X_g|/|G|$ .  $|X_g|$  is the number of elements that  $gx = x$  holds.
- Linearity of Expectation:  $\mathbb{E}[aX + bY] = a\mathbb{E}[X] + b\mathbb{E}[Y]$ . If independent,  $\mathbb{E}[XY] = \mathbb{E}[X]\mathbb{E}[Y]$ .
- Variance:  $\text{Var}(X+a) = \text{Var}(X)$ ;  $\text{Var}(aX) = a^2\text{Var}(X)$ .
- Covariance:  $\text{cov}(X, Y) = \mathbb{E}[(X - \mathbb{E}[X])(Y - \mathbb{E}[Y])] = \mathbb{E}[XY] - \mathbb{E}[X]\mathbb{E}[Y]$ .
- $\text{Var}(X) = \text{cov}(X, X)$ ;  $\text{cov}(aX+bY, cW+dV) = accov(X, W) + (\text{cyclic})$ .
- $\text{Var}(aX+bY) = a^2\text{Var}(X) + b^2\text{Var}(Y) + 2ab\text{cov}(X, Y)$ .

### 3.3 • Thirtyfold Way

Given  $n$  items, divide it up to  $k$  batches.  $n, k \geq 1$ . Batches can be empty on Problem 0, 1, 2.

- A: Distinguishable items onto Sequence of Lists.
- B: Distinguishable items onto Sequence of Sets.
- C: Indistinguishable items onto Sequence of Bunches.
- D: Distinguishable items onto Collection of Lists.
- E: Distinguishable items onto Collection of Sets.
- F: Indistinguishable items onto Collection of Bunches.
- 0: You are given sequence  $a$  that  $\sum ia_i = n$  and  $\sum a_i = k$ . There must be exactly  $a_i$  batches that have size  $i$ .
- 1: Each Batch must contain at most 1 item.
- 2: It's fine as long as you have  $k$  batches.
- 3: Each Batch must contain at least 1 item.
- 4: You are only given  $n$ , and are to find sum of Problem 3 for all  $b$ .

For Problem 0, define  $\alpha = \langle a_0, a_1, \dots, a_n \rangle$ . Let  $\iota = \langle 1, \dots, 1, 2, \dots, 2, \dots, n, \dots, n \rangle$  where  $x$  appears  $a_x$  times.

Let  $\alpha! = a_0!a_1!\dots a_n!$  and  $\alpha^+! = a_1!a_2!\dots a_n!$ . Let  $\iota! = 1!\dots 1!2!\dots 2!\dots n!\dots n!$ .

Let  $C(k, \alpha) = k!/\alpha!$  and  $C(n, \iota) = n!/\iota!$ .

	0	1	2	3	4
A	$n!C_{k,\alpha}$	$k_{(n)}$	$k^{(n)}$	$C_{n-1,k-1}n!$	$2^{n-1}n!$
B	$C_{k,\alpha}C_{n,\iota}$	$k_{(n)}$	$k^n$	$k!S_{n,k}$	$\sum_{k=1}^n k!S_{n,k}$
C	$C_{k,\alpha}$	$C_{k,n}$	$H_{k,n}$	$C_{n-1,k-1}$	$2^{n-1}$
D	$m!/a^+$	$[n \leq k]$	$\sum_{i=1}^k C_{n-1,k-1}n!/i!$	$C_{n-1,k-1}n!/k!$	$\sum_{k=1}^n C_{n-1,k-1}n!/k!$
E	$C_{m,\iota}/\alpha^+$	$[n \leq k]$	$\sum_{i=1}^k S_{n,i}$	$S_{n,k}$	$B_n$
F	1	$[n \leq k]$	$\sum_{i=1}^k p_{n,i}$	$p_{n,k}$	$p_n$

### 3.4 • Lindström-Gessel-Viennot Lemma

Let  $w(P)$  be the product of the weights of the edges of the path  $P$ . Let  $D$  be the matrix with  $D_{i,j}$  be the sum of  $w(P)$ s with  $i \rightarrow j$ .

Then,  $\det(D) = \sum_{(P_1, \dots, P_N): S \rightarrow T} \text{sign}(\sigma(P)) \prod_{i=1}^N w(P_i)$ , where  $(P_1, \dots, P_N)$  is the  $N$  non-intersecting paths, with  $P_i = A_i \rightarrow B_{\sigma(i)}$ .

When every edge have weight 1,  $w(P) = 1$ . Therefore, the lemma above will just find the number of possible non-intersecting path (with parity of the permutation).

### 3.5 • Generating Function

Let  $A(x)$  be the GF of the sequence  $a_i$ .  $a$  is 0-indexed.

- If  $A$  is OGF,  $a_n = A^{(n)}(0)/n!$ .
- If  $A$  is EGF,  $a_n = A^{(n)}(0)$ .
- If  $C(x) = kA(x) + lB(x)$ , then  $c_i = ka_i + lb_i$ .
- If  $B(x) = xA'(x)$ , then  $b_i = ia_i$ .
- Let  $\langle b_0, b_1, \dots, b_k, b_{k+1}, \dots \rangle = \langle 0, 0, \dots, 0, a_0, a_1, \dots \rangle$ .
  - If  $A$  and  $B$  are both OGF, then  $B(x) = x^k A(x)$ .
  - If  $A$  and  $B$  are both EGF, then  $B(x) = \int^{(k)} A(x) dx$ .
- Let  $\langle b_0, b_1, \dots \rangle = \langle a_k, a_{k+1}, \dots \rangle$ .
  - If  $A$  and  $B$  are both OGF, then  $B(x) = (A(x) - a_0 - a_1x - \dots - a_{k-1}x^{k-1})/x^k$ .
  - If  $A$  and  $B$  are both EGF, then  $B(x) = \frac{d^k}{dx^k} A(x)$ .
- Let  $C(x) = A(x)B(x)$ .
  - If  $A$  and  $B$  are both OGF, then  $c_i = \sum_{k=0}^i a_k b_{i-k} = (a * b)_i$ .
  - If  $A$  and  $B$  are both EGF, then  $c_i = \sum_{k=0}^i \binom{i}{k} a_k b_{i-k}$ .
- Let  $k$  be a positive integer, and let  $B(x) = A(x)^k$ .
  - If  $A$  and  $B$  are both OGF, then  $b_n = \sum_{i_1+i_2+\dots+i_k=n} a_{i_1}a_{i_2}\dots a_{i_k}$ .
  - If  $A$  and  $B$  are both EGF, then  $b_n = \sum_{i_1+i_2+\dots+i_k=n} \frac{n!}{i_1!i_2!\dots i_k!} a_{i_1}a_{i_2}\dots a_{i_k}$ .
- If  $A$  and  $B$  are both OGF with  $B(x) = \frac{A(x)}{1-x}$ , then  $b_i = a_0 + a_1 + \dots + a_i$ .
- $(1+x)^k = \sum_{n=0}^{\infty} \binom{k}{n} x^n$ .
- $\frac{1}{(1-x)^k} = \sum_{n=0}^{\infty} \binom{n+k-1}{n} x^n = \sum_{n=0}^{\infty} k H_n x^n$ .

## 4 Mathematics - Algebra

### 4.1 • Well-known Formulas

- $\sum_{n=0}^{\infty} n/2^n = 2$ .
- Lagrange's Identity:  $(\sum_i a_i^2)(\sum_i b_i^2) - (\sum_i a_i b_i)^2 = \sum_{i < j} (a_i b_j - a_j b_i)^2$ .
- Vieta's Formula: For a polynomial  $\sum_i a_i x^i$ ,  $\sum_{i_1 < i_2 < \dots < i_k} \prod_{j=1}^k r_{i_j} = (-1)^k a_{n-k}/a_n$ .
- Let Fibonacci Number be  $F_n = n$  if  $n \leq 1$  else  $F_{n-1} + F_{n-2}$ .
- $\sum_{k=0}^n F_k = F_{n+2} - 1$  and  $\sum_{k=0}^n F_k^2 = F_n F_{n-1}$ .
- $\sum_{k=0}^{n-1} F_{2k+1} = F_{2n}$  and  $\sum_{k=0}^n F_{2k} = F_{2n+1} - 1$ .
- $F_m F_{n+1} + F_{m-1} F_n = F_{m+n}$  and  $F_m F_{n+1} - F_{m-1} F_n = (-1)^n F_{m-n}$ .
- $F_{2n} = F_{n+1}^2 - F_{n-1}^2 = F_n(F_{n+1} + F_{n-1})$ .
- $\gcd(F_m, F_n) = F_{\gcd(m, n)}$ .
- Fibonacci Number mod  $p$  have period with at most  $6n$ .
- Given  $m > n > 0$  with  $\gcd(m, n) = 1$  and  $2 \mid mn$ ,  $(m^2 - n^2, 2mn, m^2 + n^2)$  is primitive Pythagorean triple.
- The number of Pythagorean triple with  $a, b \leq c = n$  is  $(\prod_{p \mid n} (2\alpha + 1) - 1)/2$ , where  $\alpha$  is the highest exponent s.t.  $p^\alpha$  divides  $n$ .
- Bernoulli Number  $b_n: \sum_{k=1}^n k^c = \frac{(-1)^k}{c+1} C_{c+1,k} b_k n^{c+1-k}; b_0 = 1; b_n = \frac{-1}{c+1} \sum_{r=0}^{r-1} C_{n+1,r} b_r$ .

### 4.2 • Well-known Linear Algebra

- Matrix:  $\text{tr}(AB) = \text{tr}(BA); (A^{-1})^T = (A^T)^{-1}$ .
- Determinant: Row Swap  $\times -1$ ; Multiply Row  $\times a$ ; Add to Other Row  $\pm 0$ .
- Determinant of a Diagonal Matrix is the product of the diagonal entries.
- $\det M = \det M^T; \det(AB) = \det A \det B$ .
- Adjoint: Let  $(\text{adj}M)_{i,j}$  be the cofactor of  $M$  at  $(i, j)$ .  $M^{-1} = \text{adj}M / \det M$ .
- Characteristic Polynomial: Let  $P_M(\lambda) = \det(\lambda I - M)$ .
- Eigenvalue:  $\lambda$ s where  $P_M(\lambda) = 0$ ; Eigenvector:  $(M - \lambda I)X = 0$  for each  $\lambda$  we got.
- Least Square:  $A$  be a matrix and  $b$  be a vector.  $\min_{x \in \mathbb{R}^n} \|Ax - b\|^2$ ;  $A^T Ax = A^T b$ .
- $AB = C$  using Randomization in  $O(N^2)$ : Create random vector  $v$ , and see  $A(Bv) = Cv$ .

### 4.3 • Well-known Calculus

- $(f(x)g(x))' = f'(x)g(x) + f(x)g'(x); (f(x)/g(x))' = (f'(x)g(x) - f(x)g'(x))/g(x)^2.$
- $(f(g(x)))' = f'(g(x))g(x). \int u dv = uv - \int v du.$
- Let  $x = g(t)$ . Then  $\int f(x)dx = \int f(g(t))g'(t)dt$ .
- $(a^x)' = a^x \ln a; \int a^x dx = a^x / \ln a + C.$
- $(\log_b |x|)' = 1/(x \ln b). \int 1/x dx = \ln|x| + C.$
- sec, csc, cot is  $1/\cos$ ,  $1/\sin$ ,  $1/\tan$  resp.
- arcsin, arccos, arctan is inverse of sin, cos, tan resp.
- sinh, cosh, tanh is  $(e^x - e^{-x})/2$ ,  $(e^x + e^{-x})/2$ , sinh / cosh resp.
- $x$  axis Rotation Volume: Assume  $f(x) \geq 0$ ,  $f$  is continuous in  $[a, b]$ .  $\int_a^b 2\pi x f(x) dx$ .

Derivative	$f(x)$	Integral (w/ $+C$ )
$\cos x$	$\sin x$	$-\cos x$
$-\sin x$	$\cos x$	$\sin x$
$\sec^2 x$	$\tan x$	$\ln \sec x $
$\sec x \tan x$	$\sec x$	$\ln \sec x + \tan x $
$-\csc x \cot x$	$\csc x$	$\ln \csc x - \cot x $
$-\csc^2 x$	$\cot x$	$\ln \sin x $
$1/\sqrt{1-x^2}$	$\arcsin x$	$x \arcsin x + \sqrt{1-x^2}$
$-1/\sqrt{1-x^2}$	$\arccos x$	$x \arccos x - \sqrt{1-x^2}$
$1/(1+x^2)$	$\arctan x$	$x \arctan x - \ln(x^2+1)/2$
$1/( x \sqrt{x^2-1})$	$\sec^{-1} x$	$x \sec^{-1} x - \cosh^{-1} x $
$-1/( x \sqrt{x^2-1})$	$\csc^{-1} x$	$x \csc^{-1} x + \cosh^{-1} x $
$-1/(1+x^2)$	$\cot^{-1} x$	$x \cot^{-1} x + \ln(x^2+1)/2$

### 4.4 • Modeling - 2-SAT - Operations

- OR:  $(a \vee b) \rightarrow (\neg a \implies b) \wedge (\neg b \implies a).$
- AND:  $(a \wedge b) \rightarrow (a \vee a) \wedge (b \vee b).$
- NAND:  $(a \overline{\wedge} b) \rightarrow \neg(a \wedge b) \rightarrow (\neg a \vee \neg b).$
- NOR:  $(a \overline{\vee} b) \rightarrow (\neg a \wedge \neg b).$
- XOR:  $(a \oplus b) \rightarrow (a \vee b) \wedge (\neg a \vee \neg b).$
- XNOR:  $(a \overline{\oplus} b) \rightarrow (a \vee \neg b) \wedge (\neg a \vee b).$

### 4.5 • Modeling - 2-SAT - At most 1

3 variables  $(a, b, c)$  can be done with  $(\neg a \vee \neg b) \wedge (\neg b \vee \neg c) \wedge (\neg c \vee \neg a)$ . This can be expanded to make  $\mathcal{O}(N^2)$  clauses.

$N$  variables  $(x_1, x_2, \dots, x_N)$  can be done with the following method. Let  $y_i$  be true if one of  $x_1, x_2, \dots, x_i$  is true. This can be modeled as following:

- $x_i \implies y_i$ .
- $y_i \implies y_{i+1}$ .
- $y_i \implies \neg x_{i+1}$ .

### 4.6 • Modeling - Minimizing Quadratic Pseudo-Boolean Function

Given  $N$  boolean variables  $x_1, x_2, \dots, x_N$ , minimize the cost  $f(x_1, x_2, \dots, x_N) = c + \sum_i b_i(x_i) + \sum_{i < j} a_{i,j}(x_i, x_j)$ . Function  $a$  must satisfies the condition  $a(0,0) + a(1,1) \leq a(0,1) + a(1,0)$ .

This can be modeled as following. Let there be source  $s$ , sink  $t$ , and  $N$  vertices  $x_1, x_2, \dots, x_N$ .

- $c$  is trivial.
- $b_i(x_i = 0)$  can be modeled as  $x_i \rightarrow t$  with weight  $b_i(0)$ .
- $b_i(x_i = 1)$  can be modeled as  $s \rightarrow x_i$  with weight  $b_i(1)$ .
- $a_{i,j}(x_i, x_j)$  can be modeled as following:
  - $s \rightarrow v_i$  with weight  $a_{i,j}(1,0)$ .
  - $v_i \rightarrow t$  with weight  $a_{i,j}(0,0)$ .
  - $s \rightarrow v_j$  with weight  $a_{i,j}(1,1) - a_{i,j}(1,0)$ .
  - $v_i \rightarrow v_j$  with weight  $a_{i,j}(0,1) + a_{i,j}(1,0) - a_{i,j}(0,0) - a_{i,j}(1,1)$ .

### 4.7 • Fast Fourier Transform & Number Theoretic Transform

```
void dft(vector<cpl>& arr, bool inv = false){ int n = arr.size();
  for (int j=0, i=1; i < n; i++){ int bit = n>>1;
    while (j & bit){ j ^= bit; bit >>= 1; } j ^= bit;
    if (i < j){ swap(arr[i], arr[j]); }
  }
  for (int l = 1; l < n; l <= 1){
    if (complex){
      ld ang = PI / l; if (inv){ ang *= -1; }
      cpl w = {cos(ang), sin(ang)};
    }
    else{
      ll w = fpow(r, (mod-1)/(2*l)); if (inv){ w = finv(w); }
      // r is primitive root of mod. 998244353 -> 3
    }
    for (int i = 0; i < n; i += l<<1){
      cpl wp = 1; for (int j = 0; j < l; j++){
        cpl a = arr[i+j], b = arr[i+j + 1] * wp;
        arr[i+j] = a+b; arr[i+j + 1] = a-b; wp *= w;
      }
    }
    if (inv){ for (int i = 0; i < n; i++){ arr[i] /= n; } }
  }
}
void mul(vector<cpl>& arr, vector<cpl>& brr){
  int n = max(arr.size(), brr.size()); n = bitp(n) * 2; // power of 2
  arr.resize(n); brr.resize(n);
  dft(arr); dft(brr);
  for (int i = 0; i < n; i++){ arr[i] *= brr[i]; }
  dft(arr, -1);
}
```

### 4.8 • Fast Welsh-Hadamard Transform

```
void fwht(vector<ll>& arr, bool inv = false){
  int n = arr.size();
  for (int l = 1; l < n; l*=2){
    for (int p = 0; p < n; p+=l*2){
      for (int i = 0; i < l; i++){
        ll a = arr[p+i], b = arr[p+l+i];
        if (XOR){ arr[p+i] = (a+b)%mod; arr[p+l+i] = (a-b)%mod; }
        if (AND){ arr[p+i] = (a + (inv ? -b : b) + mod) % mod; }
        if (OR){ arr[p+l+i] = (b + (inv ? -a : a) + mod) % mod; }
      }
    }
    if (inv && XOR){ for (int i = 0; i < n; i++){ arr[i] *= invn; } }
  }
}
```

### 4.9 • Gauss-Jordan Elimination

Gauss-Jordan Elimination is not stable. It is recommended that you use partial pivoting, which always choose the row that has the maximum absolute value on pivoting column.

For each column  $c$ : Let  $r$  be the argmax of  $|A_{r,c}|$ ,  $r \geq p$ . swap  $r$ -th and  $p$ -th row, then apply  $A_{r,c} = 1$ , then apply  $A_{i,c} = 0$  for all  $i \neq p$ .

### 4.10 • Floor Sum of Arithmetic Progression

$$\text{Let } f(a, b, c, n) = \sum_{x=0}^n \left\lfloor \frac{ax+b}{c} \right\rfloor.$$

$$\text{If } a \geq c \text{ or } b \geq c, \text{ then } f(a, b, c, n) = \frac{n(n+1)}{2} \left\lfloor \frac{a}{c} \right\rfloor + (n+1) \left\lfloor \frac{b}{c} \right\rfloor + f(a \bmod c, b \bmod c, c, n).$$

Otherwise, we have  $f(a, b, c, n) = nm - f(c, c - b - 1, a, m - 1)$  where  $m = \left\lfloor \frac{an+b}{c} \right\rfloor$ .

## 4.11 • Linear Programming

If possible, minimize the number of variables.

Primal: Maximize  $\mathbf{c}^T \mathbf{x}$  subject to  $A\mathbf{x} \leq \mathbf{b}$  and  $\mathbf{x} \geq 0$ .

Dual: Maximize  $-\mathbf{b}^T \mathbf{y}$  subject to  $-A^T \mathbf{y} \leq -\mathbf{c}$  and  $\mathbf{y} \geq 0$ .

**Time Complexity:**  $O(NM)$  per pivot,  $O(2^N)$  at worst.  $O(N^3)$ ?

```
int n, m; vector<int> slk, piv;
matrix<ld> mat;
void init(const matrix<ld> &a, const vector<ld> &b, const vector<ld> &c){

else{
    if (r23 == 0 || r12 == 0 && st == 2 || r31 == 0 && st == n-1){ /* Line */ }
    else{ /* Inside */ }
}
```

### 5.6 • Point in Non-convex Polygon

If the point is on the line, then whatever do what the problem says.  
Otherwise, send the straight line  $(x, y)$  to  $(x + X, y + X + 1)$  with  $X$  being sufficiently large integer.  
Then, count the number of intersections.

### 5.7 • Rotating Calipers

```
int j = 0; for (int i = 0; i < sp; i++){
    while (j < sp){
        int ip = (i+1) % sp, jp = (j+1) % sp;
        pl2 l = { arr[ip].fr - arr[i].fr, arr[ip].sc - arr[i].sc };
        pl2 r = { arr[jp].fr - arr[j].fr, arr[jp].sc - arr[j].sc };
        if (ccw({0, 0}, l, r) < 0){ break; }
        ans = max(ans, dist(i, j)); j += 1;
    } if (j < sp){ ans = max(ans, dist(i, j)); }
}
```

### 5.8 • Tangent Line on a Convex Polygon

Let  $i_1$  and  $i_2$  be the result of  $\text{tangent}(p, -1)$  and  $\text{tangent}(p, +1)$  respectively. The visible vertices from  $p$  is  $P_{i_1}$  to  $P_{i_2}$ . Note that the index is cyclic i.e. if  $i_1 > i_2$  then the visible vertices are  $P_{i_1}$  to  $P_n$  and  $P_1$  to  $P_{i_2}$ .

If there are multiple tangent line on the single direction, it returns the nearest one. Test  $\text{prv}$  and  $\text{nxt}$  resp. for farthest in dir  $-1$  and  $+1$ , resp.

```

## 6 Graph Theory - Connectivity

### 6.1 • Strongly Connected Component

Time Complexity:  $\mathcal{O}(V + E)$ .

```

stack<int> stk; int scc[N+20];
int ord[N+20], ont;
int dfs(int now){
    stk.push(now); int res = ord[now] = ++ont;
    for (int nxt : adj[now]){
        if (ord[nxt] == 0){ res = min(res, dfs(nxt)); }
        else if (scc[nxt] == 0){ res = min(res, ord[nxt]); }
    }
    if (res == ord[now]){
        while (!stk.empty()){
            int vtx = stk.top(); stk.pop();
            scc[vtx] = now; if (vtx == now){ break; }
        }
    } return res;
}

```

### 6.2 • Solution of the 2-SAT

```

for (int i = -n; i <= +n; i++){
    if (i == 0){ continue; }
    if (ord[i+Z] == 0){ dfs(i+Z); }
}
for (int i = 1; i <= n; i++){
    if (scc[i+Z] == scc[-i+Z]){ cout << -1; return; }
}
for (int i = -n; i <= +n; i++){
    if (i == 0){ continue; }
    int v = i+Z; for (int w : adj[v]){
        int pv = scc[v], pw = scc[w]; if (pv == pw){ continue; }
        dag[pv].push_back(pw); ind[pw] += 1;
    }
}
queue<int> q; for (int i = -n; i <= +n; i++){
    if (i == 0){ continue; }
    int v = i+Z; if (scc[v] != v){ continue; }
    if (ind[v] == 0){ q.push(v); }
} while (!q.empty()){
    int v = q.front(); q.pop();
    for (int p : sccv[v]){
        if (ans[p] != 0){ continue; }
        ans[p] = -1; ans[-(p-Z)+Z] = +1;
    }
    for (int w : dag[v]){
        ind[w] -= 1; if (ind[w] == 0){ q.push(w); }
    }
}

```

### 6.3 • Biconnected Component

Time Complexity:  $\mathcal{O}(V + E)$ .

```

pi3 edg[100020]; // {{v, w}, color}
vector<int> adj[100020]; // Edge Index
stack<int> stk;
int ord[100020], ont = 0;
int dfs(int now, int pre){
    int res = ord[now] = ++ont;
    for (int ei : adj[now]){
        int nxt = edg[ei].fr.fr ^ edg[ei].fr.sc ^ now;
        if (nxt == pre){ continue; }
        if (ord[nxt] > ord[nxt]){ stk.push(ei); }
        if (ord[nxt] > 0){ res = min(res, ord[nxt]); }
        else{
            int val = dfs(nxt, now); res = min(res, val);
            if (val >= ord[now]){
                vector<int> v; while (!stk.empty()){
                    int e = stk.top(); stk.pop();
                    edg[e].sc = ei; if (e == ei){ break; }
                }
            }
        }
    }
    return res;
}

```

### 6.4 • Articulation Point & Edge

- Articulation Point: Vertex with 2 or more colors.
- Articulation Edge: Edge that has unique color.

## 7 Graph Theory - Network Flow & Matching

### 7.1 • Kőnig's Theorem (and More)

On a Bipartite Graph, Size of Minimum Vertex Cover is equal to the size of Maximum Matching.  
Size of Maximum Independent Set is  $V - \text{size of Minimum Vertex Cover}$ .

### 7.2 • Hall's Marriage Theorem

A bipartite graph  $G = (X + Y, E)$  has a perfect  $X$ -matching iff for all subset  $V \subseteq X$ ,  $|V| \leq |N_G(V)|$ .  
A bipartite graph  $G = (X + Y, E)$  have a maximum  $X$ -matching of size  $|X| - \max_{V \subseteq X} |V| - |N_G(V)|$ .

### 7.3 • Dinitz

```

int n, m; int src, snk, nc; ll adj[220][220];
int dis[220];
bool bfs(int st, int ed){
    memset(dis, -1, sizeof(dis)); dis[st] = 0;
    queue<int> q; q.push(st); while (!q.empty()){
        int now = q.front(); q.pop();
        for (int nxt = 0; nxt < nc; nxt++){
            if (adj[now][nxt] == 0){ continue; }
            if (dis[nxt] != -1){ continue; }
            dis[nxt] = dis[now]+1; q.push(nxt);
        }
    } return dis[ed] != -1;
}
bool chk[220]; int ptr[220];
int pth[220], pc;
bool dfs(int now, int idx){

```

```

pth[idx] = now; chk[now] = 1; if (now == snk){ pc = idx; return 1; }
for (int& nxt = ptr[now]; nxt < nc; nxt++){
    if (adj[now][nxt] == 0){ continue; }
    if (dis[now]+1 != dis[nxt]){ continue; }
    if (chk[nxt]){ continue; }
    if (dfs(nxt, idx+1)){ return 1; }
} return 0;
}

memset(ptr, 0, sizeof(ptr)); memset(chk, 0, sizeof(chk));
ll ans = 0; while (bfs(src, snk)){
    memset(ptr, 0, sizeof(ptr)); memset(chk, 0, sizeof(chk));
    while (dfs(src, 0)){
        memset(chk, 0, sizeof(chk));
        ll res = INF; for (int i = 1; i <= pc; i++){
            int v = pth[i-1], w = pth[i];
            res = min(res, adj[v][w]);
        } ans += res;
        for (int i = 1; i <= pc; i++){
            int v = pth[i-1], w = pth[i];
            adj[v][w] -= res; adj[w][v] += res;
        }
    }
}

```

## 7.4 • Minimum Path Cover

Given a DAG, Minimum Vertex Path Cover can be computed as follow. Divide the vertex  $v$  onto  $v_l$  and  $v_r$ . For each edge  $v \rightarrow w$ , connect  $v_l$  and  $w_r$ . Number of path you need to use is the  $V$  - Maximum Matching.

Minimum Edge Path Cover is just Eulerian Path in disguise.

## 7.5 • Modeling - Flow with Demands

- $\text{req}_i$  = required flow  $i$ th vertex need to send
  - $\text{req}_i < 0$ : Need to get it from source
  - $\text{req}_i > 0$ : Need to send it to sink
- $v \rightarrow w$  with lower/upper bound of  $l$  and  $u$ .
  - $\text{req}_v = l$ ;  $\text{req}_w = -l$
  - Capacity of  $v \rightarrow w = u - l$
- Create new source and sink, and connect the  $v$  with source or sink with capacity  $|\text{req}_v|$ .
- From the old sink to old source, connect an edge with the capacity  $\infty$ . If there were none, ignore this.
- MaxFlow should be equal to  $\sum_{\text{req}_v > 0} |\text{req}_v|$  in order to satisfy the original graph.

## 7.6 • Minimum Cost Maximum Flow w/ SPFA

```

int src, snk, nc; pi2 adj[220][220]; // (flow, cost)
int dis[220]; bool chk[220]; int pre[220];
int pth[220]; int pc;
bool spfa(int st, int ed){
    memset(dis, 0x3f, sizeof(dis)); memset(chk, 0, sizeof(chk));
    queue<int> q; dis[st] = 0; chk[st] = 1; q.push(st);
    while (!q.empty()){
        int now = q.front(); q.pop(); chk[now] = 0;
        for (int nxt = 1; nxt <= nc; nxt++){
            if (adj[now][nxt].fr == 0){ continue; }
            if (dis[nxt] <= dis[now] + adj[now][nxt].sc){ continue; }
            dis[nxt] = dis[now] + adj[now][nxt].sc; pre[nxt] = now;
            if (nxt == ed){ return 1; }
            if (dis[nxt] < dis[ed]) q.push(nxt);
        }
    }
    return 0;
}

```

```

        if (!chk[nxt]){ chk[nxt] = 1; q.push(nxt); }
    }
    if (dis[ed] == INF){ return 0; }
    int ptr = ed; pc = 0;
    while (ptr != st){ pth[pc++] = ptr; ptr = pre[ptr]; } pth[pc] = ptr;
    reverse(pth, pth+pc+1); return 1;
}

```

```

int ans = 0, res = 0; while (spfa(src, snk)){
    int cnt = INF; for (int i = 1; i <= pc; i++){
        int v = pth[i-1], w = pth[i];
        cnt = min(cnt, adj[v][w].fr);
    } res += cnt;
    for (int i = 1; i <= pc; i++){
        int v = pth[i-1], w = pth[i];
        adj[v][w].fr -= cnt; adj[w][v].fr += cnt;
        ans += cnt*adj[v][w].sc;
    }
}

```

## 7.7 • Stable Marriage Problem

For  $i$  in 1 to  $N$ , try to match the best possible matching  $j$ , knocking other matchings in process. This matching is best for proposer  $i$  while worst for proposee  $j$ .

```

int adj[1020][1020]; int rnk[1020][1020]; // adj[i][r] -> j // rnk[j][i] -> r
int ptr[1020]; int res[1020]; // ptr[i] = r // res[j] = i

```

```

bool f(int i, int j){
    if (res[j] == 0){ res[j] = i; return 1; }
    int p = res[j]; if (rnk[j][p] > rnk[j][i]){
        res[j] = i; ptr[p] += 1; for (int& r = ptr[p]; ; r++){
            if (f(p, adj[p][r])){ break; }
        } return 1;
    } return 0;
}

```

```

for (int i = 1; i <= n; i++){ ptr[i] = 1; }
for (int i = 1; i <= n; i++){
    for (int& r = ptr[i]; ; r++){
        if (f(i, adj[i][r])){ break; }
    }
}

```

## 7.8 • Hungarian Algorithm

```

// Max version. for Min, adj[v][w] *= -1, then print -ans.
11 adj[520][520];
11 l1[520], l2[520]; 11 d[520]; int di[520];

```

## 8 Graph Theory - Miscellaneous

### 8.1 • Eulerian Path

Directed version. For undirected use  $e_i = (v_i, w_i)$  and save  $i$  like BCC.  
 $\text{vector<int>} \text{adj}[200020]; \text{int ptr}[200020];$

```

int pth[200020]; int len;
void dfs(int now){
    pth[++len] = now;
    for (int& p = ptr[now]; p < adj[now].size();){
        int nxt = adj[now][p++];
        dfs(nxt);
    }
}

8.2 • Tree Isomorphism

int dep[2][100020]; vector<int> vtx[2][100020]; int par[2][100020];
int dfs(int t, int v, int p){
    dep[t][v] = dep[t][p]+1; vtx[t][dep[t][v]].push_back(v);
    par[t][v] = p; erase(adj[t][v], p);
    int res = dep[t][v]; for (int w : adj[t][v]){
        if (w == p){ continue; }
        res = max(res, dfs(t, w, v));
    } return res;
}

int val[2][100020]; int ans[100020];
using pvi = pair<vector<int>, int>;

centroid(0, 1); pi2 c0 = cent; centroid(1, 1); pi2 c1 = cent;
if ((c0.sc == -1) != (c1.sc == -1)){ cout << "EI"; return; }
for (int t = 0; t < 2; t++){
    pi2& c = (t==0 ? c0 : c1); if (c.sc == -1){ continue; }
    int v = c.fr, w = c.sc; erase(adj[t][v], w); erase(adj[t][w], v);
    adj[t][v].push_back(n+1); adj[t][w].push_back(n+1);
    adj[t][n+1].push_back(v); adj[t][n+1].push_back(w);
    c = {n+1, 0};
}

cout << "JAH" << endl; for (int i = 1; i <= n; i++){ cout << ans[i]-1 << endl; }

```

### 8.3 • Graph Realization Problem

Simple Undirected Graph with Degree Sequence  $d_1 \geq d_2 \geq \dots \geq d_n$  exists iff  $\sum_i d_i$  is even and  $\sum_{i=1}^k d_i \leq k(k-1) + \sum_{i=k+1}^n \min(d_i, k)$  holds for every  $1 \leq k \leq n$ .

You can construct the graph by picking  $d_1$  and connecting it to  $2, 3, \dots, d_{d_1+1}$  and pass everything else as induction. Note that  $d_2, d_3, \dots, d_{d_1+1}$  also decreases by 1 by doing this, and thus might need reordering.

Simple Directed Graph with In/Outdegree Sequence  $(a_1, b_1), (a_2, b_2), \dots, (a_n, b_n)$  with  $a$  being nonincreasing exists iff  $\sum_i a_i = \sum_i b_i$  and  $\sum_{i=1}^n a_i \leq \sum_{i=1}^n \min(b_i, k-1) + \sum_{i=k+1}^n \min(b_i, k)$ .

You can construct the graph by picking  $\max b_i$  and connecting it to vertices with  $\max a_j$ s.

Simple Bipartite Graph with Degree sequence  $a_1 \geq a_2 \geq \dots \geq a_n$  and  $b_1 \geq b_2 \geq \dots \geq b_m$  exists iff  $\sum_i a_i = \sum_j b_j$  and  $\sum_{i=1}^n a_i \leq \sum_{i=1}^m \min(b_i, k)$  for all  $1 \leq k \leq n$ .

You can construct the graph by greedily matching  $a_i$  with  $\max b_j$ s, for  $i$  in 1 to  $n$ .

### 8.4 • Number of Spanning Trees

Let  $c_{i,j}$  be the number of edges. Let  $M_{i,j}$  be  $-c_{i,j}$  if  $i \neq j$ , and  $\deg i$  otherwise. Then the number of spanning trees of the graph is the any cofactor of  $M$ .

For directed spanning tree,  $c_{i,j} = (i \rightarrow j)$  and  $c_{i,i} = \deg i$ . The number of spanning trees are the cofactor of  $(r, r)$ .

## 9 Dynamic Programming

Monge (intersection is better than containment): CHT, DnC opt, WQS, MonoQ, Knuth.

### 9.1 • Rerooting

Tree DP, with changing root. For all direction: Edge  $v \rightarrow w$ , set root as  $v$  and record subtree  $w$ .

**Time Complexity:**  $\mathcal{O}(N)$ .

```

void reroot(int now, int pre){
    ans[now] = dp[now]; for (int nxt : adj[now]){
        if (nxt == pre){ continue; }
        int dpv = dp[now], dpw = dp[nxt];
        dp[now] -= (dp[nxt]?); dp[nxt] += (dp[now]?);
        reroot(nxt, now);
        dp[now] = dpv; dp[nxt] = dpw;
    }
} // dpf(root, root); reroot(root, root)

```

### 9.2 • Sum over Subset

$$D_S = \sum_{T \subseteq S} A_T.$$

**Time Complexity:**  $\mathcal{O}(N2^N)$ .

```

for (int i = 0; i < X; i++) dp[i] = arr[i];
for (int b = 0; b < B; b++){
    for (int bit = 0; bit < X; bit++){
        if (bit>>b & 1){ dp[bit] += dp[bit ^ 1<<b]; }
    }
}

```

### 9.3 • Convex Hull Trick

$$D_i = \max_{j < i} a_j x_j + b_j.$$

**Time Complexity:**  $\mathcal{O}(N)$  for  $N$  insertions,  $\mathcal{O}(\log N)$  for query.

```

inline ld crs(pl2 l1, pl2 l2){ return (l1)(l2.sc-l1.sc)/(l1.fr-l2.fr); }
pair<pl2, ld> stk[1000020]; int sp = 0;
inline void psh(pl2 p){
    stk[sp].fr = p; stk[sp].sc = (sp==0 ? 0 : crs(stk[sp-1].fr, stk[sp].fr));
    sp += 1;
}

```

```

}

inline void pop(){ sp -= 1; }

// query: x
int st = 0, ed = sp; while (st+1 <= ed-1){
    int mid = st+ed >> 1;
    if (x < stk[mid].sc){ ed = mid; } else{ st = mid; }
} p12 p = stk[st].fr; // A(j)x + B(j)
dp[i] = p.fr*x + p.sc + C(i);
// update: p = (A(j), B(j))
while (sp > 0){
    if (crs(stk[sp-1].fr, p) <= stk[sp-1].sc){ pop(); } else{ break; }
} psh(p);

```

## 9.4 • Divide and Conquer Optimization

$$D_{k,i} = \max_{j < i} D_{k-1,j} + A_{j,i}, \text{opt}_i < \text{opt}_{i+1}.$$

Time Complexity:  $\mathcal{O}(KN \log N)$ .

```

11 dp[2][N+20]; // Sliding Window on first index
void dnc_opt(11* dp1, 11* dp0, int is, int ie, int os, int oe){
    if (is > ie){ return; } int im = is+ie >> 1;
    int o = os; for (int p = os; p <= min(oe, im-1); p++){
        if (f(dp0, p, im) < f(dp0, o, im)){ o = p; }
    } dp1[im] = f(dp0, o, im);
    dnc_opt(dp1, dp0, is, im-1, os, o); dnc_opt(dp1, dp0, im+1, ie, o, oe);
}

```

## 9.5 • WQS Binary Search (Aliens Trick)

$$D_{k,i} = \min_{j < i} D_{k-1,j} + A_{j,i}, D_{k,N} \text{ must be convex.}$$

Time Complexity:  $\mathcal{O}(T(N) \log X)$ .

```

// solve(n, mid) returns the number of used elements
// Binary Search over Lambda
11 st = 0, ed = 1e18; 11 ans = 1e18;
while (st <= ed){
    11 mid = st+ed >> 1;
    int cnt = solve(n, mid); ans = min<1128>(ans, dp[n] + (i128)mid*k);
    if (cnt <= k){ ed = mid-1; } else{ st = mid+1; }
} cout << ans;

```

## 9.6 • Monotone Queue Optimization

$D_i = \min_{j < i} D_j + A_{j,i}$ . For all pair  $i < j$ , there exists a unique point  $p$  that  $D_i + C_{i,p}$  and  $D_j + C_{j,p}$  changes. So  $k < p$  means  $<$ , and  $\geq$  otherwise.

Time Complexity:  $\mathcal{O}(N \log N)$ .

Code from BOJ 17439 - Flower Shop.

```
11 arr[50020]; 11 prf[50020];
```

```

deque<int> dq;
p12 dp[50020];
inline 11 f(int j, int i){ return (prf[i]-prf[j])*(i-j); }
inline 11 dpf(int j, int i){ return dp[j].fr + f(j, i); }
inline int crx(int a, int b, int n){ // Assume a < b.
    int st = b+1, ed = n; int i = n+1; while (st <= ed){
        int mid = st+ed >> 1;
        if (dpf(a, mid) >= dpf(b, mid)){ i = mid; ed = mid-1; }
        else{ st = mid+1; }
    } return i;
}
int solve(int n, 11 x){
    dp[0] = {0, 0}; for (int i = 1; i <= n; i++){

```

```

        while (dq.size() >= 2){
            int dql = dq.size();
            int a = dq[dql-2], b = dq[dql-1];
            if (crx(a, b, n) >= crx(b, i-1, n)){ dq.pop_back(); }
            else{ break; }
        } dq.push_back(i-1);
        while (dq.size() >= 2){
            int a = dq[0], b = dq[1];
            if (crx(a, b, n) <= i){ dq.pop_front(); }
            else{ break; }
        } int j = dq.front();
        dp[i] = {dpf(j, i), dp[j].sc+1};
        //cout << dp[i].fr << " \n"[i==n];
    } return dp[n].sc;
}

```

## 9.7 • Slope Trick

Let  $f$  be a convex piecewise linear function with integer coefficient. We can save this function by the points where the line changes, with one linear function.

We can add two functions by merging the points without removing duplicates, and adding the linear function. Use priority\_queue if needed.

## 9.8 • Knuth Optimization

$$D_{i,j} = D_{i,k} + D_{k+1,j} + A_{i,j} \text{ where } \text{opt}_{i,j-1} \leq \text{opt}_{i,j} \leq \text{opt}_{i+1,j}.$$

Time Complexity:  $\mathcal{O}(N^2)$ .

```

for (int d = 0; d < n; d++){
    for (int s=1, e=1+d; e <= n; s++, e++){
        if (d == 0){ dp[s][e] = 0; opt[s][e] = s; }
        else{
            opt[s][e] = s; dp[s][e] = INF;
            for (int p = opt[s][e-1]; p <= opt[s+1][e]; p++){
                11 res = dp[s][p] + dp[p+1][e] + prf[e]-prf[s-1];
                if (dp[s][e] > res){ dp[s][e] = res; opt[s][e] = p; }
            }
        }
    }
} cout << dp[1][n] << endl;

```

## 9.9 • Kitamasa

$A_n = \prod_{i=1}^k A_{n-d} C_d$ . The code below uses arr as initial terms with index 0 to  $n-1$ . And f as coefficient of  $x^n - \sum_{d=1}^k C_d x^{n-d}$ .

```

const 11 mod = 104857601; const 11 r = 3;

11 fpow(11 mul, 11 bit){
    11 res = 1; while (bit){

    return dp[y][x][bit];
}
dpf(0, 0, string(m, '0')) // minimize the sum of arr[i][j], connected.

```

## 9.12 • Permutation DP

Let  $D_{i,j}$  be the number of pre-permutations that uses the value from 1 to  $i$ , and has  $j$  components. The transition is to:

- Create new component:  $(i, j) \rightarrow (i+1, j+1)$ .
- Append  $i+1$  to one of the component:  $(i, j) \rightarrow (i+1, j)$ .
- Connect two components using  $i+1$ :  $(i, j) \rightarrow (i+1, j-1)$ .

When the starting/ending point is specified, you need to be careful about the number of *open-ended* points.

## 11.7 • Centroid Tree

Repeatedly apply centroid to the subtrees, and make the tree. The height of the centroid tree is at most  $\lfloor \log_2 N \rfloor + 1$ .

Also, the path  $v \Rightarrow w$  from original tree always pass through LCA of  $v$  and  $w$  in centroid tree.

```

vector<int> tree[100020]; int par[100020];
int dfs(int v){
    centroid(v); v = cent.fr; chk[v] = 1;
    for (pi2 e : adj[v]){
        int w = e.fr; if (chk[w]){ continue; }
        int p = dfs(w); tree[v].push_back(p); par[p] = v;
    } return v;
}

```

## 11.8 • Permutation Tree

upd and qry is range add update and range min query, using LazySeg.

```

for (int i = 1; i <= n; i++){ val[i] = {arr[i], arr[i]}; pos[i] = {i, i}; }

    for (int i = 1; i <= q; i++) cout << evt[qrr[i].ed].sc << endl; // ed = first possible
}

```

## 12.5 • CDQ Divide and Conquer

3D LIS. Find longest chain  $(A_i, B_i, C_i)$  s.t.  $A_i < A_j; B_i < B_j; C_i < C_j$  holds.

```

// upd(p, x, t) / t = 0: A[p] = x / t = 1: A[p] = max(A[p], x)
// qry(s, e) / max A[s..e]
// Assume arr is sorted via A.
void dnc(int st, int ed){
    if (st == ed){ arr[st].dp = max(arr[st].dp, 1); return; }
    int mid = st+ed >> 1; dnc(st, mid);
    sort(arr+st, arr+mid+1, [](const T& a, const T& b){ return a.b < b.b; });
    vector<int> qrr; for (int i = mid+1; i <= ed; i++) qrr.push_back(i);
    sort(qrr.begin(), qrr.end(), [](int i1, int i2){ return arr[i1].b < arr[i2].b; });
    int ptr = st; for (int i : qrr){
        while (ptr <= mid){
            if (arr[ptr].b < arr[i].b) upd(arr[ptr].c, arr[ptr].dp); ptr += 1;
            else{ break; }
        }
        arr[i].dp = max(arr[i].dp, qry(1, arr[i].c)+1);
    } for (int i = st; i <= mid; i++) upd(arr[i].c, 0);
    return dnc(mid+1, ed);
}

```

## 13 Greedy

### 13.1 • Job Scheduling w/ Deadline & Duration

```

pl2 arr[250020]; // {deadline, duration}
sort(arr+1, arr+n+1, [](pl2 p1, pl2 p2){ return p1.fr > p2.fr; });
priority_stack<ll> pq; int ans = 0;
int i = 1; while (i <= n){
    int j = i; while (j <= n){
        if (arr[i].fr == arr[j].fr){ j += 1; } else{ break; }
    }
    for (int p = i; p < j; p++) pq.push(arr[p].sc);
    ll tim = arr[i].fr - arr[j].fr; while (tim > 0){
        if (pq.empty()){ break; } ll t = pq.top(); pq.pop();
        ll d = min(t, tim); if (t-d == 0){ tim -= d; ans += 1; }
        else{ tim -= d; t -= d; pq.push(t); }
    } i = j;
} cout << ans;

```

### 13.2 • Bounded Scheduling

If  $x \geq B_i$ , then  $x \leftarrow x + A_i$ .  $B_i + A_i \geq 0$ .

```

pl2 arr[100020]; // (A[i], B[i])
sort(arr+1, arr+n+1, [](pl2 p1, pl2 p2){
    ll a1 = p1.fr, b1 = p1.sc;
    ll a2 = p2.fr, b2 = p2.sc;
    if ((a1 >= 0) != (a2 >= 0)){ return (a1 >= 0) > (a2 >= 0); }
    if (a1 >= 0){ return b1 < b2; } else{ return a1+b1 > a2+b2; }
});
ll x = 0; for (int i = 1; i <= n; i++){
    if (x < arr[i].sc){ /* Impossible; Quit */ }
    x += arr[i].fr;
} /* Possible */

```

## 14 Heuristics

Let the candidate be  $S$ , and  $f$  be the scoring function. Lower score is better. Hyperparameter can be changed based on the problem.

It is strictly recommended to return the global minimum, rather than the final result. If possible, alter the score rather than completely recalculate it.

## 14.1 • Simulated Annealing

Hyperparameter:  $d = 0.9999$  (higher = faster cooling),  $k = 10$  (higher = more volatile)

1. Set  $t = 1$  and generate random answer  $S$ , and compute the score  $F = f(S)$ .
2. Repeat the following:
  - (a) Randomly change the answer  $S$  to generate  $S'$ .
  - (b) Compute  $p = e^{(f(S) - f(S'))/kt}$ .
  - (c) Change the answer to  $S'$  with probability  $\min(p, 1)$ .

## 14.2 • Diversified Late Acceptance Search

Hyperparameter:  $l = 5$  (higher = longer memory)

1. Generate random answer  $S$ , and compute the score  $F = f(S)$ .
2. Set  $P_i = F$  for all  $1 \leq i \leq l$ . Set  $k = 0$ .
3. Repeat the following:
  - (a) Set  $F_* = F$  and generate  $S'$ , and compute  $F' = f(S')$ .
  - (b) If  $F' = F$  or  $F' < \max P$ , change the answer (and score) to  $S'$  (and  $F'$ ).
  - (c) If  $F > P_k$  or ( $F < P_i$  and  $F < F_*$ ), set  $P_i = F$ .
  - (d) Set  $k = (k + 1) \bmod l$ .

## 15 Code Snippet - C++

### 15.1 • Default Setting

```
#include <bits/stdc++.h>
#define endl '\n'
const int PRECISION = 0;
using namespace std;

void Main(){}
}

int main(){
    ios_base::sync_with_stdio(0); cin.tie(0); cout.tie(0);
    cout.setf(ios::fixed); cout.precision(PRECISION); Main();
}
```

### 15.2 • Line Input

```
inline void icl(istream& in){ in.ignore(998244353, '\n'); } // Between cin and getline
string s; getline(cin, s); // No newline at the end
```

### 15.3 • Vector Manipulation

```
template <typename T> inline void unq(vector<T>& v){
    sort(v.begin(), v.end()); v.erase(unique(v.begin(), v.end()), v.end());
}
template <typename T> inline int cvt(vector<T>& v, T x){
    return lower_bound(v.begin(), v.end(), x) - v.begin();
}
template <typename T> inline void erase(vector<T>& v, const T& x){
    v.erase(remove(v.begin(), v.end(), x), v.end());
} // removes every x in v
```

### 15.4 • Bitwise Function

```
inline int bit1(int x){ return __builtin_popcount(x); } // # of 1
inline int bit2(int x){ return x==0 ? 32 : __builtin_ctz(x); } // max k s.t. n | 2^k
inline int bitl(int x){ return x==0 ? 0 : 32 - __builtin_clz(x); } // # of bits
inline int bith(int x){ return x==0 ? 0 : 1 << bitl(x)-1; } // max 2^k s.t. 2^k <= n
inline int bitp(int x){
    int y = bith(x); return x==0 ? 0 : y << (x!=y);
} // min 2^k s.t. n <= 2^k
```

## 15.5 • Randomization

```
const time_t TIME = chrono::high_resolution_clock::now().time_since_epoch().count();
mt19937 gen(TIME);
uniform_int_distribution<int> rng(a, b); // [a, b] range
int value = rng(gen); shuffle(begin, end, gen);

15.6 • Custom Hash
```

```
struct custom_hash {
    static uint64_t splitmix64(uint64_t x) {
        x += 0x9e3779b97f4a7c15;
        x = (x ^ (x >> 30)) * 0xb58476d1ce4e5b9;
        x = (x ^ (x >> 27)) * 0x94d049bb133111eb;
        return x ^ (x >> 31);
    }
}
```

```
size_t operator()(uint64_t x) const {
    static const uint64_t FIXED_RANDOM =
        chrono::steady_clock::now().time_since_epoch().count();
    return splitmix64(x + FIXED_RANDOM);
}
```

```
unordered_map<ll, int, custom_hash> mp;
```

### 15.7 • Policy Based Data Structure

```
#include <ext/pb_ds/tree_policy.hpp>
#include <ext/pb_ds/assoc_container.hpp>
using namespace __gnu_pbds;
template <typename T> using ordered_set = tree<T, null_type, less<T>, rb_tree_tag,
tree_order_statistics_node_update>;
template <typename K, typename V> using ordered_map = tree<K, V, less<K>, rb_tree_tag,
tree_order_statistics_node_update>;
```

```
ordered_set<int> s; s.insert(value);
s.find_by_order(index); // 0-based, returns iterator
s.order_of_key(value); // 0-based, lower_bound
```

```
ordered_map<int, int> mp;
mp.insert({1, 4}); mp[4] = 7;
mp.find_by_order(1)->first // key, 4
mp.find_by_order(1)->second // value, 7
```

### 15.8 • Custom Comparison

```
bool cmp(int a, int b){ return a < b; }
sort(begin, end, cmp); // a -> b
set<int, decltype(&cmp)> s(cmp); // a -> b (inorder)
priority_queue<int, vector<int>, decltype(&cmp)> pq(cmp); // b on top

sort(v.begin(), v.end(), [](pi2 a, pi2 b){ return a.fr+a.sc < b.fr+b.sc; });
auto st = lower_bound(v.begin(), v.end(), x, [](pi2 p, int x){ return p.fr+p.sc < x; });
auto ed = upper_bound(v.begin(), v.end(), x, [](int x, pi2 p){ return x < p.fr+p.sc; });
// [st, ed) is where p.fr+p.sc == x

struct cmp{
    bool operator()(const pi2& p1, const pi2& p2){ return p1.fr+p1.sc < p2.fr+p2.sc; }
};
tree<pi2, null_type, cmp, rb_tree_tag, tree_order_statistics_node_update> s;
```

## 15.9 • Dynamic Bitset

```
const int MAX = 200000;
template <int N = 1> void solve(int n){
    if (N < n){ return solve<min(N*2, MAX)>(n); }
}
```

## 16 Code Snippet - Python

### 16.1 • Default Setting

```
import sys; input = lambda: sys.stdin.readline().rstrip('\n')
inputs = lambda t, l=tuple: l(map(t, input().split()))
sys.setrecursionlimit(100000)
```

### 16.2 • List Manipulation

```
l.reverse(); l = list(reversed(l))
l.sort(); l = sorted(l)
```

### 16.3 • Arbitrary Precision

```
from fractions import * # Fraction, no limit
x = Fraction(10)
```

```
from decimal import * # Decimal, limited
getcontext().prec = 28 # Number of precision = digits
```

### 16.4 • Data Structure

```
from collections import deque
q = deque() # Deque
q.append(x); q.appendleft(x)
x = q.pop(); x = q.popleft()
```

```
import heapq # Heap
pq = []
heapq.heappush(pq) # push
x = heapq.heappop(pq) # pop
```

### 16.5 • Custom Hashing

```
import time; TIME = int(time.time() * 1000)
dict[(x, TIME)] # anti-hash
```

### 16.6 • Custom Comparison

```
from functools import cmp_to_key
def cmp(a, b): return sgn(a-b) # a < b then -, a > b then +, otherwise 0
l.sort(key=cmp_to_key(cmp)); sorted(l, key=cmp_to_key(cmp))
```

## 17 Miscellaneous

### 17.1 • List of Primes

- $\leq 10^3$ : 168 primes, max 997.
- $\leq 10^5$ : 1 229 primes, max 99 991.
- $\leq 10^6$ : 9 592 primes, max 999 983.
- $\leq 10^9$ : 50 847 534 primes, max 999 999 937.
- $\leq 10^{12}$ : max 999 999 999 989.
- $\leq 10^{18}$ : max 999 999 999 999 989.
- $998\ 244\ 353 = 119 \times 2^{23} + 1$  with  $\omega = 3$ .
- $167\ 772\ 161 = 5 \times 2^{26} + 1$  with  $\omega = 3$ .
- $469\ 762\ 049 = 13 \times 2^{27} + 1$  with  $\omega = 3$ .
- $2\ 281\ 701\ 377 = 17 \times 2^{27} + 1$  with  $\omega = 3$ .
- $2\ 483\ 027\ 969 = 37 \times 2^{26} + 1$  with  $\omega = 3$ .
- $2013\ 265\ 921 = 15 \times 2^{27} + 1$  with  $\omega = 31$ .

### 17.2 • List of Highly Composite Numbers

- 840: 32 divisors (3, 1, 1, 1)
- 83 160: 128 divisors (3, 3, 1, 1, 1)
- 720 720: 240 divisors (4, 2, 1, 1, 1, 1)
- 735 134 400: 1 344 divisors (6, 3, 2, 1, 1, 1, 1)
- 963 761 198 400: 6 720 divisors (6, 4, 2, 1, 1, 1, 1, 1)
- 897 612 484 786 617 600: 103 680 divisors (8, 4, 2, 2, 1, 1, 1, 1, 1, 1, 1)

### 17.3 • ASCII Table

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
0	NUL	SOH	STX	ETX	EOT	ENQ	ACK	BEL	BS	TAB	LF	VT	FF	CR	SO	SI
1	DLE	DC1	DC2	DC3	DC4	NAK	SYN	ETB	CAN	EM	SUB	ESC	FS	GS	RS	US
2	SP	!	"	#	\$	%	&	'	(	)	*	+	,	-	.	/
3	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?
4	@	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
5	P	Q	R	S	T	U	V	W	X	Y	Z	[	\	^	-	-
6	`	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o
7	p	q	r	s	t	u	v	w	x	y	z	{	}		~	DEL

### 17.4 • UTF-8 Input

Converting U+uvwxyz. ASCII: 0 to 7F; Korean: AC00 to D7A3.

- 0 to 7F: 0yyyzzz.
- 80 to 7FF: 110xxxxy 10yyzzzz.
- 800 to FFFF: 1110www 10xxxxyy 10yyzzzz.
- 10000 to 10FFFF: 11110uvv vvvwww 10xxxxyy 10yyzzzz.
