1 Have You Tried...

1.1 • Soft Techniques

- Reading the problem once more? Again?
- Thinking whether or not your claim is actually true?
- Representing it as a formular?
- Finding some global monovariant that does not care about the locality?
- Finding some auxiliary property?
- Just play around with the constraint with no or little intention to reach the goal?
- Examining small cases, by hands or using computer?
- Checking the possible range of the answer?
- Checking variants of the problem?
- Trying to come up with a counterexample of the claim? Why does it or does it not work?
- Thinking about why a certain hard technique you tried failed, and/or convincing yourself that it cannot work?
- Start from scratch, with completely different ideas?
- Stop whining and start implement things?
- Stop whining and start write everything?
- Intentionally find suboptimal time complexity that passes in order to lower the amount of code you need to write?

1.2 • Hard Techniques

- Any of the algorithms listed below?
- Dynamic Programming? Divide and Conquer?
- Greedy? or a Network Flow? What about Regret Greedy?
- In terms of Regret Greedy: Let A_k and A_{k+1} be the solution. Does $A_{k+1} - A_k$ cannot have proper subset that sums to 0?
- In terms of $A_{k+1} - A_k$: for proper subset sums to 0, = 0 means different A_{k+1} picking, > 0 and < 0 means A_k and A_{k+1} (resp.) is not optimal.
- Randomization?
- Square Root Decomposition? Or other bucket size like $B = O(\sqrt{N \log N})$?
- Sparse Table to bypass $O(\log N)$ query time?
- Backtracking? With some pruning?
- Heuristics?
- Using smaller type? (e.g. double instead of long double)?

2 Mathematics - Number Theory

2.1 • Lifting the Exponent Lemma

Let p be a prime, and x and y be integers. Let $v_p(x)$ be the number of times you can divide x by p .

- If p is odd:
 - If $p \mid x - y$, then $v_p(x^n - y^n) = v_p(x - y) + v_p(n)$.
 - If $p \mid x + y$ and n is odd, then $v_p(x^n + y^n) = v_p(x + y) + v_p(n)$.
 - If $p \mid x + y$ and n is even, then $v_p(x^n + y^n) = 0$.
- If $p = 2$:
 - If $p \mid x - y$ and n is odd, then $v_p(x^n - y^n) = v_p(x - y)$.

- If $p \mid x - y$ and n is even, then $v_p(x^n - y^n) = v_p(x - y) + v_p(x + y) + v_p(n) - 1 = v_p((x^2 - y^2)/2) + v_p(n)$.
- If $p^2 \mid x - y$ and x and y are both odd, then $v_p(x^n - y^n) = v_p(x - y) + v_p(n)$.
- If $p \mid x + y$ and n is odd, then $v_p(x^n + y^n) = v_p(x + y)$.
- If $p \mid x + y$ and n is even, then $v_p(x^n + y^n) = 1$.

- For all p :

- If $p \mid x - y$ and $p \nmid n$, then $v_p(x^n - y^n) = v_p(x - y)$.
- If $p \mid x + y$ and $p \nmid n$ and n is odd, then $v_p(x^n + y^n) = v_p(x + y)$.

2.2 • Extended Euclidean Algorithm

The solutions to $ax + by = g$ is $(x + bk/g, y - ak/g)$.

```
p13 egcd(ll a, ll b){
    if (b == 0){ return {{1, 0}, a}; }
    p13 p = egcd(b, a%b);
    ll x = p.fr.fr, y = p.fr.sc, g = p.sc;
    ll xx = y, yy = x - a/b*y;
    return {{xx, yy}, g};
} inline ll finv(ll a, ll b){ p13 p = egcd(a, b); return
(p.fr.fr%b+n)%b; }
```

2.3 • Chinese Remainder Theorem

```
p12 crt(p12 f1, p12 f2){
    if (f1.sc < f2.sc){ swap(f1, f2); }
    ll a1 = f1.fr, m1 = f1.sc; ll a2 = f2.fr, m2 = f2.sc;
    ll g = gcd(m1, m2); ll l = lcm(m1, m2);
    if ((a2-a1)%g != 0){ return {-1, -1}; }
    ll mg1 = m1/g, mg2 = m2/g, ag = (a2-a1)/g;
    ll y = ag * finv(mg1, mg2) %mg2;
    ll x = m1*y + a1; return {(x%l+1)%l, l};
}
```

2.4 • Möbius Function

```
int phi[X+20], mob[X+20], prr[X+20];
memset(mob, -1, sizeof(mob)); mob[1] = 1;
for (int x = 1; x <= X; x++){ phi[x] = x; }
for (int x = 2; x <= X; x++){
    if (prr[x] == 0){
        for (int a = x; a <= X; a+=x){ prr[a] = x; phi[a] -=
            phi[a]/x; }
        int p = prr[x]; mob[x] = (x/p%p == 0 ? 0 :
            mob[x/p]*mob[p]);
    }
}
```

2.5 • Miller-Rabin

```
const vector<ll> prr = {2, 3, 5, 7, 11, 13, 17, 19, 23, 29,
31, 37};
bool prime(ll n){
    if (n <= 40){
        for (int p : prr){ if (n == p){ return 1; } }
        return 0;
    } if (n%2 == 0){ return 0; }
    int s = 0; ll d = n-1; while (d%2 == 0){ s += 1; d /= 2; }
    for (int p : prr){
        ll res = 1, mul = p, bit = d; while (bit){
            if (bit&1){ res = (i128)res*mul % n; }
            mul = (i128)mul*mul % n; bit >>= 1;
        }
        bool chk = (res == 1); for (int r = 0; r < s; r++){
```

```
        chk |= (res == n-1); res = (i128)res*res % n;
    } if (!chk){ return 0; }
    } return 1;
}
2.6 • Pollard's Rho
vector<ll> ans;
inline ll f(ll x, ll c, ll mod){ return ((i128)x*x + c) %
mod; }
void factor(ll n){
    if (n == 1){ return; }
    if (n%2 == 0){ ans.push_back(2); return factor(n/2); }
    if (prime(n)){ ans.push_back(n); return; }
    uniform_int_distribution<ll> rnd(1, n);
    ll x1 = rnd(gen); ll x2 = x1;
    ll c = rnd(gen); do{
        x1 = f(x1, c, n); x2 = f(f(x2, c, n), c, n);
    } while (gcd(abs(x1-x2), n) == 1);
    ll g = gcd(abs(x1-x2), n);
    if (g == n){ return factor(n); }
    else{ factor(g); factor(n/g); }
}
```

2.7 • Power Tower

$CUT \geq \log_2 m$ is that $a^{\phi(m)} \not\equiv 1 \pmod{m}$ can happen. But for $d \geq \log_2 m$, $a^{d+\phi(m)} \equiv a^d \pmod{m}$.

```
const ll INF = 1e18; // INF > mod^2; might need i128
ll fpow(ll mul, ll bit, ll mod, ll lim = INF){
    ll res = 1; while (bit){
        if (bit&1){ res = min(res*mul, lim) % mod; }
        mul = mul*mul % mod; bit >>= 1;
    } return res;
}
```

```
const int CUT = 100, LEN = 4; // CUT >= log2(mod); A = [2 for
1..LEN] > CUT
int n; int arr[1000020];
int solve(int idx){
    int val = 1; for (int i = n; i >= idx; i--){
        val = fpow(arr[i], val, (CUT+1)*(CUT+2), CUT+1);
    } return val;
}
int solve(int idx, int mod){
    if (mod == 1){ return 0; }
    if (idx == n){ return arr[idx] % mod; }
    if (n-idx+1 <= LEN){
        if (solve(idx+1) <= CUT){ return fpow(arr[idx],
            solve(idx+1), mod); }
    }
    int m = phi[mod];
    return fpow(arr[idx], solve(idx+1, m) + CUT*m, mod);
}
```

2.8 • Iterating Floor of k/n

```
vector<p12> v; // saves {floor(k/n), # of k}.
ll sq = (ll)sqrt(n);
for (ll i = 1; i <= sq; i++){
    ll val = n/i; if (v.empty() || v.back().fr != val){
        v.push_back({val, 1}); }
```

```

    else{ v.back().sc += 1; }
}
for (ll x = sq; x >= 1; x--){
    ll st = max(sq+1, n/(x+1)+1), ed = n/x;
    if (st <= ed){ v.push_back({x, ed-st+1}); }
}

```

2.9 • Modular Inverse of 1 to X

```

inv[0] = 0; inv[1] = 1; for (int x = 2; x < X; x++){
    inv[x] = inv[mod/x]*(mod-mod/x) % mod;
}

```

3 Mathematics - Combinatorics

3.1 • Well-known Sequences

Let $x^{(k)}$ be the product of x to $x+k-1$, and $x_{(k)}$ be the product of x to $x-k+1$. Let $C_{n,r} = \binom{n}{r}$ and $H_{n,r} = \binom{n+r-1}{r}$. Let $P_{n,r} = n!/r!$. Derangement is the number of permutation with $\pi_i \neq i$ for all i .

$D_0 = 1; D_1 = 0; D_n = (n-1)(D_{n-1} + D_{n-2})$.

Catalan Number is the number of valid Regular Bracket Sequence with n pairs.

$C_0 = 1; C_{n+1} = (4n+2)C_n/(n+2)$. Def: $C_{n+1} = \sum_{k=0}^n C_k C_{n-k}$.

Stirling Number of the First Kind is the number of permutation with n elements and k cycles.

$s_{0,0} = 1; s_{n,0} = s_{0,k} = 0; s_{n,k} = (n-1)s_{n-1,k} + s_{n-1,k-1}$.

Stirling Number of the Second Kind is the number of ways to partition a set of n distinct objects onto k non-empty subsets.

$S_{0,0} = 1; S_{n,0} = S_{0,k} = 0; S_{n,k} = kS_{n-1,k} + S_{n-1,k-1}$.

Bell Number is the number of ways to partition a set of n distinct objects.

$B_n = \sum_{k=0}^n S_{n,k} = \sum_{k=0}^n C_{n,k} B_k$.

Partition Number is the number of ways to partition n nondistinct objects into collection of k non-empty bunches.

$p_{n,k} = p_{n-1,k-1} + p_{n-k,k}$. $p_n = \sum_{k=1}^n p_{n,k}$.

3.2 • Well-known Formulas

- Lucas's Theorem: $C_{n,r} \equiv C_{n \bmod p, r \bmod p} C_{n/p, r/p} \pmod{p}$.
- Vandermonde's Identity: $\sum_{k=0}^r C_{n,k} C_{m,r-k} = C_{n+m,r}$.
- Hockey-Stick Identity: Assuming $n > r$, $\sum_{k=r}^n C_{k,r} = C_{n+1,r+1}$.
- $\sum_{k=r}^n C_{n,k} C_{k,r} = 2^{n-k}$.
- $\sum_{k=1}^n C_{n,k} C_{c-1,k-1} = C_{2n-1,n-1}$.
- $\sum_{k \leq n} C_{n,k} a^{n-k} b^k = ((a+b)^n - (a-b)^n)/2$.
- $\sum_{k \text{ is odd}} C_{n,k} a^{n-k} b^k = ((a+b)^n - (a-b)^n)/2$.
- $\sum_{k=0}^n C_{r,k}/C_{n,k} = C_{n+1,n-r+1}/C_{n,r}$.
- Number of involutions: $I_0 = I_1 = 1; I_n = I_{n-1} + (n-1)I_{n-2}$.
- Number of permutations of size n where every cycles have length $\leq k$: $T_{n,k} = n!$ if $n \leq k$ else $nT_{n-1,k} - (n-1)_{(k)}T_{n-k-1,k}$.
- Catalan Number = Number of permutations of length n that avoids the pattern 123.
- Number of prefix RBS of length $n+k$ with n opens and k closes: $C_{n+k,k}(n-k+1)/(n+1)$.
- Number of RBS of length $2n$ with exactly k '()'s: $C_{n,k}C_{n,k-1}/n$.
- Stirling Number of the Second Kind but each subset's size $\geq r$: $S_{r,n+1,k} = kS_{r,n,k} + C_{n,r-1}S_{r,n-r+1,k-1}$.
- Stirling Number of the Second Kind but pairwise distance $\geq d$: $S_{n-d+1,k-d+1}$, assuming $n \geq k \geq d$.
- Burnside: Let G be a group. $r = \sum_{g \in G} |X_g|/|G|$. $|X_g|$ is the number of elements that $gx = x$ holds.

- Linearity of Expectation: $\mathbb{E}[aX + bY] = a\mathbb{E}[X] + b\mathbb{E}[Y]$. If independent, $\mathbb{E}[XY] = \mathbb{E}[X]\mathbb{E}[Y]$.
- Variance: $\text{Var}(X+a) = \text{Var}(X)$; $\text{Var}(aX) = a^2\text{Var}(X)$.
- Covariance: $\text{cov}(X,Y) = \mathbb{E}[(X - \mathbb{E}[X])(Y - \mathbb{E}[Y])] = \mathbb{E}[XY] - \mathbb{E}[X]\mathbb{E}[Y]$.
- $\text{Var}(X) = \text{cov}(X,X)$; $\text{cov}(aX+bY, cW+dV) = \text{accov}(X,W) + \text{cyclic}$.
- $\text{Var}(aX+bY) = a^2\text{Var}(X) + b^2\text{Var}(Y) + 2\text{abcov}(X,Y)$.

3.3 • Thirtyfold Way

Given n items, divide it up to k batches. $n, k \geq 1$. Batches can be empty on Problem 0, 1, 2.

- A: Distinguishable items onto Sequence of Lists.
- B: Distinguishable items onto Sequence of Sets.
- C: Indistinguishable items onto Sequence of Bunches.
- D: Distinguishable items onto Collection of Lists.
- E: Distinguishable items onto Collection of Sets.
- F: Indistinguishable items onto Collection of Bunches.
- 0: You are given sequence a that $\sum ia_i = n$ and $\sum a_i = k$. There must be exactly a_i batches that have size i .
- 1: Each Batch must contain at most 1 item.
- 2: It's fine as long as you have k batches.
- 3: Each Batch must contain at least 1 item.
- 4: You are only given n , and are to find sum of Problem 3 for all b .

For Problem 0, define $\alpha = \langle a_0, a_1, \dots, a_n \rangle$. Let $\iota = \langle 1, \dots, 1, 2, \dots, 2, \dots, n, \dots, n \rangle$ where x appears a_x times.

Let $\alpha! = a_0!a_1!\dots a_n!$ and $\alpha^{+!} = a_1!a_2!\dots a_n!$. Let $\iota! = 1!\dots 1!2!\dots 2!\dots n!\dots n!$.

Let $C(k, \alpha) = k!/\alpha!$ and $C(n, \iota) = n!/\iota!$.

	0	1
2	3	4
A $k^{(n)}$	$n!C_{k,\alpha}$ $C_{n-1,k-1}n!$	$k^{(n)}$ $2^{n-1}n!$
B k^n	$C_{k,\alpha}C_{n,\iota}$ $k!S_{n,k}$	$k^{(n)}$ $\sum_{k=1}^n k!S_{n,k}$
C $H_{k,n}$	$C_{k,\alpha}$ $C_{n-1,k-1}$	$C_{k,n}$ 2^{n-1}
D $\sum_{i=1}^k C_{n-1,k-1}n!/i!$	$C_{n-1,k-1}n!/k!$	$\sum_{k=1}^n C_{n-1,k-1}n!/k!$
E $\sum_{i=1}^k S_{n,i}$	$C_{m,\iota}/\alpha^{+!}$ $S_{n,k}$	$[n \leq k]$ B_n
F $\sum_{i=1}^k p_{n,i}$	1 $p_{n,k}$	$[n \leq k]$ p_n

3.4 • Lindström-Gessel-Viennot Lemma

Let $w(P)$ be the product of the weights of the edges of the path P . Let D be the matrix with $D_{i,j}$ be the sum of $w(P)$ s with $i \rightarrow j$.

Then, $\det(D) = \sum_{(P_1, \dots, P_N): S \rightarrow T} \text{sign}(\sigma(P)) \prod_{i=1}^N w(P_i)$, where $(P_1, \dots, P_N)$ is the N non-intersecting paths, with $P_i = A_i \rightarrow B_{\sigma(i)}$.

When every edge have weight 1, $w(P) = 1$. Therefore, the lemma above will just find the number of possible non-intersecting path (with parity of the permutation).

3.5 • Generating Function

Let $A(x)$ be the GF of the sequence a_i . a is 0-indexed.

- If A is OGF, $a_n = A^{(n)}(0)/n!$.
- If A is EGF, $a_n = A^{(n)}(0)$.
- If $C(x) = kA(x) + lB(x)$, then $c_i = ka_i + lb_i$.
- If $B(x) = xA'(x)$, then $b_i = ia_i$.
- Let $\langle b_0, b_1, \dots, b_{k-1}, b_k, b_{k+1}, \dots \rangle = \langle 0, 0, \dots, 0, a_0, a_1, \dots \rangle$.
 - If A and B are both OGF, then $B(x) = x^k A(x)$.
 - If A and B are both EGF, then $B(x) = \int^{(k)} A(x) d^k x$.
- Let $\langle b_0, b_1, \dots \rangle = \langle a_k, a_{k+1}, \dots \rangle$.
 - If A and B are both OGF, then $B(x) = (A(x) - a_0 - a_1x - \dots - a_{k-1}x^{k-1})/x^k$.
 - If A and B are both EGF, then $B(x) = \frac{d^k}{dx^k} A(x)$.
- Let $C(x) = A(x)B(x)$.
 - If A and B are both OGF, then $c_i = \sum_{k=0}^i a_k b_{i-k} = (a * b)_i$.
 - If A and B are both EGF, then $c_i = \sum_{k=0}^i \binom{i}{k} a_k b_{i-k}$.
- Let k be a positive integer, and let $B(x) = A(x)^k$.
 - If A and B are both OGF, then $b_n = \sum_{i_1+i_2+\dots+i_k=n} a_{i_1}a_{i_2}\dots a_{i_k}$.
 - If A and B are both EGF, then $b_n = \sum_{i_1+i_2+\dots+i_k=n} \frac{n!}{i_1!i_2!\dots i_k!} a_{i_1}a_{i_2}\dots a_{i_k}$.
- If A and B are both OGF with $B(x) = \frac{A(x)}{1-x}$, then $b_i = a_0 + a_1 + \dots + a_i$.
- $(1+x)^k = \sum_{n=0}^{\infty} \binom{k}{n} x^n$.
- $\frac{1}{(1-x)^k} = \sum_{n=0}^{\infty} \binom{n+k-1}{n} x^n = \sum_{n=0}^{\infty} k H_n x^n$.

4 Mathematics - Algebra

4.1 • Well-known Formulas

- $\sum_{n=0}^{\infty} n/2^n = 2$.
- Lagrange's Identity: $(\sum_i a_i^2)(\sum_i b_i^2) - (\sum_i a_i b_i)^2 = \sum_{i < j} (a_i b_j - a_j b_i)^2$.
- Vieta's Formula: For a polynomial $\sum_i a_i x^i$, $\sum_{i_1 < i_2 < \dots < i_k} \prod_{j=1}^k r_{i_j} = (-1)^k a_{n-k}/a_n$.
- Let Fibonacci Number be $F_n = n$ if $n \leq 1$ else $F_{n-1} + F_{n-2}$.
- $\sum_{k=0}^n F_k = F_{n+2} - 1$ and $\sum_{k=0}^n F_k^2 = F_n F_{n+1}$.
- $\sum_{k=0}^{n-1} F_{2k+1} = F_{2n}$ and $\sum_{k=0}^n F_{2k} = F_{2n+1} - 1$.
- $F_m F_{n+1} + F_{m-1} F_n = F_{m+n}$ and $F_m F_{n+1} - F_{m-1} F_n = (-1)^n F_{m-n}$.
- $F_{2n} = F_{n+1}^2 - F_{n-1}^2 = F_n(F_{n+1} + F_{n-1})$.
- $\gcd(F_m, F_n) = F_{\gcd(m,n)}$.
- Fibonacci Number mod p have period with at most $6n$.
- Given $m > n > 0$ with $\gcd(m,n) = 1$ and $2 \mid mn$, $(m^2 - n^2, 2mn, m^2 + n^2)$ is primitive Pythagorean triple.
- The number of Pythagorean triple with $a, b \leq c = n$ is $(\prod_{p \mid n} (2\alpha + 1) - 1)/2$, where α is the highest exponent s.t. p^α divides n .
- Bernoulli Number b_n : $\sum_{k=1}^n k^c = \frac{(-1)^k}{c+1} C_{c+1,k} b_k n^{c+1-k}$; $b_0 = 1$; $b_n = \frac{-1}{c+1} \sum_{r=0}^{n-1} C_{n+1,r} b_r$.

4.2 • Well-known Linear Algebra

- Matrix: $\text{tr}(AB) = \text{tr}(BA)$; $(A^{-1})^T = (A^T)^{-1}$.
- Determinant: Row Swap $\times -1$; Multiply Row $\times a$; Add to Other Row ± 0 .
- Determinant of a Diagonal Matrix is the product of the diagonal entries.
- $\det M = \det M^T$; $\det(AB) = \det A \det B$.
- Adjoint: Let $(\text{adj} M)_{i,j}$ be the cofactor of M at (i, j) . $M^{-1} = \text{adj} M / \det M$.
- Characteristic Polynomial: Let $P_M(\lambda) = \det(\lambda I - M)$.
- Eigenvalue: λ s where $P_M(\lambda) = 0$; Eigenvector: $(M - \lambda I)X = 0$ for each λ we got.
- Least Square: A be a matrix and b be a vector. $\min_{x \in \mathbb{R}^n} \|Ax - b\|^2$; $A^T Ax = A^T b$.
- $AB = C$ using Randomization in $O(N^2)$: Create random vector v , and see $A(Bv) = Cv$.

4.3 • Well-known Calculus

- $(f(x)g(x))' = f'(x)g(x) + f(x)g'(x)$; $(f(x)/g(x))' = (f'(x)g(x) - f(x)g'(x))/g(x)^2$.
- $(f(g(x)))' = f'(g(x))g'(x)$. $\int u dv = uv - \int v du$.
- Let $x = g(t)$. Then $\int f(x)dx = \int f(g(t))g'(t)dt$.
- $(a^x)' = a^x \ln a$; $\int a^x dx = a^x / \ln a + C$.
- $(\log_b |x|)' = 1/(x \ln b)$. $\int 1/x dx = \ln |x| + C$.
- sec, csc, cot is $1/\cos$, $1/\sin$, $1/\tan$ resp.
- arcsin, arccos, arctan is inverse of sin, cos, tan resp.
- sinh, cosh, tanh is $(e^x - e^{-x})/2$, $(e^x + e^{-x})/2$, $\sinh/\cosh$ resp.
- x axis Rotation Volume: Assume $f(x) \geq 0$, f is continuous in $[a, b]$. $\int_a^b 2\pi x f(x) dx$.

Derivative	$f(x)$	Integral (w/ $+C$)
$\cos x$	$\sin x$	$-\cos x$
$-\sin x$	$\cos x$	$\sin x$
$\sec^2 x$	$\tan x$	$\ln \sec x $
$\sec x \tan x$	$\sec x$	$\ln \sec x + \tan x $
$-\csc x \cot x$	$\csc x$	$\ln \csc x - \cot x $
$-\csc^2 x$	$\cot x$	$\ln \sin x $
$1/\sqrt{1-x^2}$	$\arcsin x$	$x \arcsin x + \sqrt{1-x^2}$
$-1/\sqrt{1-x^2}$	$\arccos x$	$x \arccos x - \sqrt{1-x^2}$
$1/(1+x^2)$	$\arctan x$	$x \arctan x - \ln(x^2+1)/2$
$1/(x \sqrt{x^2-1})$	$\sec^{-1} x$	$x \sec^{-1} x - \cosh^{-1} x $
$-1/(x \sqrt{x^2-1})$	$\csc^{-1} x$	$x \csc^{-1} x + \cosh^{-1} x $
$-1/(1+x^2)$	$\cot^{-1} x$	$x \cos^{-1} x + \ln(x^2+1)/2$

4.4 • Modeling - 2-SAT - Operations

- OR: $(a \vee b) \rightarrow (\neg a \implies b) \wedge (\neg b \implies a)$.
- AND: $(a \wedge b) \rightarrow (a \vee a) \wedge (b \vee b)$.
- NAND: $(a \nabla b) \rightarrow \neg(a \wedge b) \rightarrow (\neg a \vee \neg b)$.
- NOR: $(a \overline{\vee} b) \rightarrow (\neg a \wedge \neg b)$.
- XOR: $(a \oplus b) \rightarrow (a \vee b) \wedge (\neg a \vee \neg b)$.
- XNOR: $(a \oplus b) \rightarrow (a \vee \neg b) \wedge (\neg a \vee b)$.

4.5 • Modeling - 2-SAT - At most 1

3 variables (a, b, c) can be done with $(\neg a \vee \neg b) \wedge (\neg b \vee \neg c) \wedge (\neg c \vee \neg a)$. This can be expanded to make $O(N^2)$ clauses.

N variables $(x_1, x_2, \dots, x_N)$ can be done with the following method. Let y_i be true if one of $x_1, x_2, \dots, x_i$ is true. This can be modeled as following:

- $x_i \implies y_i$.
- $y_i \implies y_{i+1}$.
- $y_i \implies \neg x_{i+1}$.

4.6 • Modeling - Minimizing Quadratic Pseudo-Boolean Function

Given N boolean variables $x_1, x_2, \dots, x_N$, minimize the cost $f(x_1, x_2, \dots, x_N) = c + \sum_i b_i(x_i) + \sum_{i < j} a_{i,j}(x_i, x_j)$. Function a must satisfy the condition $a(0, 0) + a(1, 1) \leq a(0, 1) + a(1, 0)$.

This can be modeled as following. Let there be source s , sink t , and N vertices $x_1, x_2, \dots, x_N$.

- c is trivial.
- $b_i(x_i = 0)$ can be modeled as $x_i \rightarrow t$ with weight $b_i(0)$.
- $b_i(x_i = 1)$ can be modeled as $s \rightarrow x_i$ with weight $b_i(1)$.
- $a_{i,j}(x_i, x_j)$ can be modeled as following:
 - $s \rightarrow v_i$ with weight $a_{i,j}(1, 0)$.
 - $v_i \rightarrow t$ with weight $a_{i,j}(0, 0)$.
 - $s \rightarrow v_j$ with weight $a_{i,j}(1, 1) - a_{i,j}(1, 0)$.
 - $v_i \rightarrow v_j$ with weight $a_{i,j}(0, 1) + a_{i,j}(1, 0) - a_{i,j}(0, 0) - a_{i,j}(1, 1)$.

4.7 • Fast Fourier Transform & Number Theoretic Transform

```
void dft(vector<cpl>& arr, bool inv = false){ int n = arr.size();
    for (int j=0, i=1; i < n; i++){ int bit = n>>1;
        while (j & bit){ j ^= bit; bit >>= 1; } j ^= bit;
        if (i < j){ swap(arr[i], arr[j]); }
    }
    for (int l = 1; l < n; l <= l){
        if (complex){
            ld ang = PI / l; if (inv){ ang *= -1; }
            cpl w = {cos(ang), sin(ang)};
        }
        else{
            ll w = fpow(r, (mod-1)/(2*l)); if (inv){ w = finv(w); }
            // r is primitive root of mod. 998244353 -> 3
        }
        for (int i = 0; i < n; i += l<<1){
            cpl wp = 1; for (int j = 0; j < l; j++){
                cpl a = arr[i+j], b = arr[i+j + l] * wp;
                arr[i+j] = a+b; arr[i+j + l] = a-b; wp *= w;
            }
        }
    }
    if (inv){ for (int i = 0; i < n; i++){ arr[i] /= n; } }
}

void mul(vector<cpl>& arr, vector<cpl>& brr){
    int n = max(arr.size(), brr.size()); n = bitp(n) * 2; // power of 2
    arr.resize(n); brr.resize(n);
    dft(arr); dft(brr);
```

```
for (int i = 0; i < n; i++){ arr[i] *= brr[i]; }
dft(arr, -1);
}
```

4.8 • Fast Welsh-Hadamard Transform

```
void fwht(vector<ll>& arr, bool inv = false){
    int n = arr.size();
    for (int l = 1; l < n; l*=2){
        for (int p = 0; p < n; p+=l*2){
            for (int i = 0; i < l; i++){
                ll a = arr[p+i], b = arr[p+l+i];
                if (XOR){ arr[p+i] = (a+b)%mod; arr[p+l+i] = (a-b+mod)%mod; }
                if (AND){ arr[p+i] = (a + (inv ? -b : b) + mod) % mod; }
                if (OR){ arr[p+l+i] = (b + (inv ? -a : a) + mod) % mod; }
            }
        }
    }
    if (inv && XOR){ for (int i = 0; i < n; i++){ arr[i] *= invn; } }
}
```

4.9 • Gauss-Jordan Elimination

Gauss-Jordan Elimination is not stable. It is recommended that you use partial pivoting, which always choose the row that has the maximum absolute value on pivoting column.

For each column c : Let r be the argmax of $|A_{r,c}|$, $r \geq p$. swap r -th and p -th row, then apply $A_{r,c} = 1$, then apply $A_{i,c} = 0$ for all $i \neq p$.

4.10 • Floor Sum of Arithmetic Progression

Let $f(a, b, c, n) = \sum_{x=0}^n \left\lfloor \frac{ax+b}{c} \right\rfloor$.

If $a \geq c$ or $b \geq c$, then $f(a, b, c, n) = \frac{n(n+1)}{2} \left\lfloor \frac{a}{c} \right\rfloor + (n+1) \left\lfloor \frac{b}{c} \right\rfloor + f(a \bmod c, b \bmod c, c, n)$.

Otherwise, we have $f(a, b, c, n) = nm - f(c, c-b-1, a, m-1)$ where $m = \left\lfloor \frac{an+b}{c} \right\rfloor$.

4.11 • Linear Programming

If possible, minimize the number of variables.

Primal: Maximize $\mathbf{c}^T \mathbf{x}$ subject to $A\mathbf{x} \leq \mathbf{b}$ and $\mathbf{x} \geq 0$.

Dual: Maximize $-\mathbf{b}^T \mathbf{y}$ subject to $-A^T \mathbf{y} \leq -\mathbf{c}$ and $\mathbf{y} \geq 0$.

Time Complexity: $O(NM)$ per pivot, $O(2^N)$ at worst. $O(N^3)$?

```
int n, m; vector<int> slk, piv;
matrix<ld> mat;
void init(const matrix<ld> &a, const vector<ld> &b, const vector<ld> &c){
    n = c.size(); m = b.size();
    slk = vector<int>(n+1); piv = vector<int>(m);
    mat = matrix<ld>(m+2, vector<ld>(n+2));
    for (int i = 0; i < m; i++){
        for (int j = 0; j < n; j++){ mat[i][j] = a[i][j]; }
    }
    for (int i = 0; i < m; i++){
        piv[i] = n+i; mat[i][n] = -1; mat[i][n+1] = b[i];
    }
    for (int j = 0; j < n; j++){
        slk[j] = j; mat[m][j] = -c[j];
    }
    slk[n] = -1; mat[m+1][n] = 1;
```

```

}

            int s = 0; for (int j = 1; j < n+1; j++){
                if (s == -1 || mkp(mat[i][j], slk[j]) < mkp(mat[i][s], slk[s])){ s = j; }
            } pivot(i, s);
        }
    }
    bool chk = simplex(1);
    vector<ld> x(n); for (int i = 0; i < m; i++){
        if (piv[i] < n){ x[piv[i]] = mat[i][n+1]; }
        return {chk ? mat[m][n+1] : inf, x};
    }
}

```

5 Mathematics - Geometry

Note that (first, second) is (y, x) . Polygon is always given as counter-clockwise order, with no 3 points in a line.

5.1 Well-known Formulas

- Distance of Point (x', y') and Line $ax + by + c = 0$: $\frac{|ax' + by' + c|}{\sqrt{a^2 + b^2}}$.
- Volume of Polygonal Pyramid: Base $\times$ Height/3.

- Volume of a Sphere: $4\pi r^3/3$. Surface Area: $4\pi r^2$.
- Pick's Theorem: if i inside and b boundary then area is $i + b/2 - 1$.
- $\sin(\alpha \pm \beta) = \sin \alpha \cos \beta \pm \cos \alpha \sin \beta$; $\sin^2(\theta/2) = (1 - \cos \theta)/2$.
- $\cos(\alpha \pm \beta) = \cos \alpha \cos \beta \mp \sin \alpha \sin \beta$; $\cos^2(\theta/2) = (1 + \cos \theta)/2$.
- $\tan(\alpha \pm \beta) = \frac{\tan \alpha \pm \tan \beta}{1 \mp \tan \alpha \tan \beta}$; $\tan^2(\theta/2) = \frac{1 - \cos \theta}{1 + \cos \theta}$.
- Let a, b, c be the length; A, B, C be the angle of a triangle.
- Let $s = (a + b + c)/2$. Then area $S = \sqrt{s(s-a)(s-b)(s-c)}$. $S = (bc \sin A)/2$.
- Radius of Circumcircle $R = abc/4S$; Radius of Incircle $r = S/s$.
- $a/\sin A = 2R$; $a^2 = b^2 + c^2 - 2bc \cos A$; $\frac{a+b}{a-b} = \frac{\tan((A+B)/2)}{\tan((A-B)/2)}$.
- Let $\mathcal{A} = b^2 + c^2 - a^2$. $\mathcal{B}$ and $\mathcal{C}$ is defined similarly. Map (a) as $(a : b : c)$, cyclic.
- Incenter: (a) ; Circumcenter: $(a^2 \mathcal{A})$; Centroid: (1) ; Orthocenter: BC .
- Excenter (A) : $(-a : b : c)$; Nine-point: $(a^2(b^2 + c^2) - (b^2 - c^2)^2)$.
- Given a center P , Let D be the intersection of AP and BC . E and F is defined similarly.
- Incenter I : AI is also an angle bisector. Circumcenter O : Circle passes A, B , and C .
- Orthocenter H : AH and BC are orthic i.e. angle is 90 deg. Centroid: $AG : GD = 2 : 1$ and $|BD| = |DC|$.
- $\text{proj}_{\mathbf{u}} \mathbf{v} = \frac{\mathbf{u} \cdot \mathbf{v}}{\mathbf{v} \cdot \mathbf{v}} \mathbf{v}$.

5.2 Nearest Pair of Point

```

sort(arr+1, arr+n+1, [](p12 p1, p12 p2){ return p12(p1.sc, p1.fr) < p12(p2.sc, p2.fr); });
int ans = dis(arr[1], arr[2]);
set<p12> s; s.insert(arr[1]); s.insert(arr[2]);
int st = 1; for (int i = 3; i <= n; i++){
    while (st < i){
        ll x = (p[st].sc - p[i].sc); if (x*x <= ans){ break; }
        else{ s.erase(arr[st]); st += 1; }
    } int d = (int)sqrt(ans)+1;
    auto l = s.lower_bound({p[i].fr - d, -INF-1});
    auto r = s.upper_bound({p[i].fr + d, INF+1});
    for (auto j = l; j != r; j++){ ans = min(ans, dis(p[i], *j)); }
    s.insert(p[i]);
}

```

5.3 Line Intersection

```

inline ll cross(const p12& v1, const p12& v2){ return v1.sc*v2.fr - v2.sc*v1.fr; }
inline p12 ltoV(const p14& l){ return {l.sc.fr - l.fr.fr, l.sc.sc - l.fr.sc}; }
int intersect(p14 l1, p14 l2){
    p12 p1 = l1.fr, p2 = l1.sc; p12 p3 = l2.fr, p4 = l2.sc;
    int c123 = ccw(p1, p2, p3), c124 = ccw(p1, p2, p4);
    int c341 = ccw(p3, p4, p1), c342 = ccw(p3, p4, p2);
    if (c123 == 0 && c124 == 0){
        if (p1 > p2){ swap(p1, p2); } if (p3 > p4){ swap(p3, p4); }
        if (p2 < p3 || p4 < p1){ /* No Intersection */ }
        if (p2 == p3 || p4 == p1){ /* Endpoint */ }
        /* Infinitely Many */
    }
    int c12 = c123*c124, c34 = c341*c342;

```

```

    if (c12 > 0 || c34 > 0){ /* No Intersection */ }
    if (c12 == 0 || c34 == 0){ /* Endpoint */ }
    /* Mid-line */
}
p12 intersection(const p14& l1, const p14& l2){
    p12 p1 = l1.fr, p2 = l1.sc; p12 p3 = l2.fr, p4 = l2.sc;

    p12 v1 = ltoV(l1), v2 = ltoV(l2); p12 d = {p3.fr - p1.fr, p3.sc - p1.sc};
    ld a = (ld)cross(d, v2) / cross(v1, v2);
    return {p1.fr + v1.fr*a, p1.sc + v1.sc*a};
}

```

5.4 Convex Hull

```

for (int i = 1; i <= n; i++){
    if (arr[i] > arr[i]) swap(arr[i], arr[i]);
} p12 p0 = arr[1]; sort(arr+2, arr+n+1, [&p0](const p12& p1, const p12& p2){
    int res = ccw(p0, p1, p2); if (res != 0){ return res > 0; }
    return dis(p0, p1) < dis(p0, p2);
});
vector<p12> stk; for (int i = 1; i <= n; i++){
    p12 p3 = arr[i]; while (stk.size() >= 2){
        p12 p1 = *prev(prev(stk.end())); p2 = *prev(stk.end());
        if (ccw(p1, p2, p3) <= 0){ stk.pop_back(); } else{ break; }
        /* < 0 if linear */
    } stk.push_back(p3);
}
for (int i = n-1; i > 1; i--){ /* if linear only */
    if (ccw(stk.front(), arr[i], stk.back()) == 0){
        stk.push_back(arr[i]);
    } else{ break; }
}

```

5.5 Point in Convex Polygon

```

int st = 2, ed = n; while (st+1 <= ed-1){
    int mid = st+ed >> 1;
    if (ccw(arr[1], arr[mid], p) == +1){ st = mid; } else{ ed = mid; }
} p12 p1 = arr[1], p2 = arr[st], p3 = arr[st+1];
int r12 = ccw(p1, p2, p), r23 = ccw(p2, p3, p), r31 = ccw(p3, p1, p);
if (r12 < 0 || r23 < 0 || r31 < 0){ /* Outside */ }
else{
    if (r23 == 0 || r12 == 0 && st == 2 || r31 == 0 && st == n-1){ /* Line */ }
    else{ /* Inside */ }
}

```

5.6 Point in Non-convex Polygon

If the point is on the line, then whatever do what the problem says. Otherwise, send the straight line (x, y) to $(x + X, y + X + 1)$ with X being sufficiently large integer. Then, count the number of intersections.

5.7 • Rotating Calipers

```
int j = 0; for (int i = 0; i < sp; i++){
    while (j < sp){
        int ip = (i+1) % sp, jp = (j+1) % sp;

```

5.8 • Tangent Line on a Convex Polygon

Let i_1 and i_2 be the result of `tangent(p, -1)` and `tangent(p, +1)` respectively. The visible vertices from p is P_{i_1} to P_{i_2} . Note that the index is cyclic i.e. if $i_1 > i_2$ then the visible vertices are P_{i_1} to P_n and P_1 to P_{i_2} .

If there are multiple tangent line on the single direction, it returns the nearest one. Test `prv` and `nxt` resp. for farthest in `dir` -1 and $+1$, resp.

```
int n; pl2 arr[100020];
inline int nxt(int i){ return i==n ? 1 : i+1; }

            if (val >= ord[now]){
                vector<int> v; while (!stk.empty()){
                    int e = stk.top(); stk.pop();
                    edg[e].sc = ei; if (e == ei){ break; }
                }
            }
        }
    }
    return res;
}

```

6.4 • Articulation Point & Edge

- Articulation Point: Vertex with 2 or more colors.
- Articulation Edge: Edge that has unique color.

7 Graph Theory - Network Flow & Matching

7.1 • König's Theorem (and More)

On a Bipartite Graph, Size of Minimum Vertex Cover is equal to the size of Maximum Matching.

Size of Maximum Independent Set is V - size of Minimum Vertex Cover.

7.2 • Hall's Marriage Theorem

A bipartite graph $G = (X + Y, E)$ has a perfect X -matching iff for all subset $V \subseteq X$, $|V| \leq |N_G(V)|$.

A bipartite graph $G = (X + Y, E)$ have a maximum X -matching of size $|X| - \max_{V \subseteq X} |V| - |N_G(V)|$.

7.3 • Dinitz

```

int n, m; int src, snk, nc; ll adj[220][220];
int dis[220];
bool bfs(int st, int ed){

```

```

    memset(dis, -1, sizeof(dis)); dis[st] = 0;
    queue<int> q; q.push(st); while (!q.empty()){
        int now = q.front(); q.pop();
        for (int nxt = 0; nxt < nc; nxt++){
            if (adj[now][nxt] == 0){ continue; }
            if (dis[nxt] != -1){ continue; }
            dis[nxt] = dis[now]+1; q.push(nxt);
        }
    } return dis[ed] != -1;
}
bool chk[220]; int ptr[220];
int pth[220], pc;
bool dfs(int now, int idx){
    pth[idx] = now; chk[now] = 1; if (now == snk){ pc = idx;
        return 1; }
    for (int& nxt = ptr[now]; nxt < nc; nxt++){
        if (adj[now][nxt] == 0){ continue; }
        if (dis[now]+1 != dis[nxt]){ continue; }
        if (chk[nxt]){ continue; }
        if (dfs(nxt, idx+1)){ return 1; }
    } return 0;
}

```

```

memset(ptr, 0, sizeof(ptr)); memset(chk, 0, sizeof(chk));
ll ans = 0; while (bfs(src, snk)){
    memset(ptr, 0, sizeof(ptr)); memset(chk, 0, sizeof(chk));
    while (dfs(src, 0)){
        memset(chk, 0, sizeof(chk));
        ll res = INF; for (int i = 1; i <= pc; i++){
            int v = pth[i-1], w = pth[i];
            res = min(res, adj[v][w]);
        } ans += res;
        for (int i = 1; i <= pc; i++){
            int v = pth[i-1], w = pth[i];
            adj[v][w] -= res; adj[w][v] += res;
        }
    }
}

```

7.4 • All Pair Minimum Cut

```

int gph[220][220];
const int INF = 1e9;
int flow(int st, int ed){
    memcpy(adj, gph, sizeof(adj)); adj[src][st] = INF;
    adj[ed][snk] = INF;
    /* Find MinCut between st and ed and return the value */
}

```

```

int par[220]; int val[220];
vector<int> tree[220]; pi3 edg[220];

```

```

int n, m; cin >> n >> m; src = 0; snk = n+1; nc = n+2;
while (m--){
    int v, w, x; cin >> v >> w >> x;
    gph[v][w] += x; gph[w][v] += x;
}
for (int v = 2; v <= n; v++){ par[v] = 1; }
for (int v = 2; v <= n; v++){

```

```

    int p = par[v]; int res = flow(v, p);
    val[v] = res;
    for (int i = 1; i <= n; i++){
        if (i == v){ continue; }
        if (par[i] != p){ continue; }
        if (dis[i] != -1){ par[i] = v; }
    }
    if (dis[par[p]] != -1){
        par[v] = par[p]; par[p] = v;
        val[v] = val[p]; val[p] = res;
    }
}
int cnt = 0; for (int v = 1; v <= n; v++){
    int p = par[v], x = val[v]; if (p == 0){ continue; }
    edg[++cnt] = {v, p, x}; tree[v].push_back(cnt);
    tree[p].push_back(cnt);
}

```

7.5 • Minimum Path Cover

Given a DAG, Minimum Vertex Path Cover can be computed as follow. Divide the vertex v onto v_l and v_r . For each edge $v \rightarrow w$, connect v_l and w_r . Number of path you need to use is the V - Maximum Matching.

Minimum Edge Path Cover is just Eulerian Path in disguise.

7.6 • Modeling - Flow with Demands

- req_i = required flow i th vertex need to send
 - $req_i < 0$: Need to get it from source
 - $req_i > 0$: Need to send it to sink
- $v \rightarrow w$ with lower/upper bound of l and u .
 - $req_v = l$; $req_w = -l$
 - Capacity of $v \rightarrow w = u - l$
- Create new source and sink, and connect the v with source or sink with capacity $|req_v|$.
- From the old sink to old source, connect an edge with the capacity ∞ . If there were none, ignore this.
- MaxFlow should be equal to $\sum_{req_v > 0} req_v$ in order to satisfy the original graph.

7.7 • Minimum Cost Maximum Flow w/ SPFA

```

int src, snk, nc; pi2 adj[220][220]; // (flow, cost)
int dis[220]; bool chk[220]; int pre[220];
int pth[220]; int pc;
bool spfa(int st, int ed){
    memset(dis, 0x3f, sizeof(dis)); memset(chk, 0,
        sizeof(chk));
    queue<int> q; dis[st] = 0; chk[st] = 1; q.push(st);
    while (!q.empty()){
        int now = q.front(); q.pop(); chk[now] = 0;
        for (int nxt = 1; nxt <= nc; nxt++){
            if (adj[now][nxt].fr == 0){ continue; }
            if (dis[nxt] <= dis[now] + adj[now][nxt].sc){ continue; }
        }
        dis[nxt] = dis[now] + adj[now][nxt].sc; pre[nxt] = now;
        if (!chk[nxt]){ chk[nxt] = 1; q.push(nxt); }
    }
}

```

```

    if (dis[ed] == INF){ return 0; }
    int ptr = ed; pc = 0;
    while (ptr != st){ pth[pc++] = ptr; ptr = pre[ptr]; }
    pth[pc] = ptr;
    reverse(pth, pth+pc+1); return 1;
}

```

```

int ans = 0, res = 0; while (spfa(src, snk)){
    cnt = INF; for (int i = 1; i <= pc; i++){
        int v = pth[i-1], w = pth[i];
        cnt = min(cnt, adj[v][w].fr);
    } res += cnt;
    for (int i = 1; i <= pc; i++){
        int v = pth[i-1], w = pth[i];
        adj[v][w].fr -= cnt; adj[w][v].fr += cnt;
        ans += cnt*adj[v][w].sc;
    }
}

```

7.8 • Stable Marriage Problem

For i in 1 to N , try to match the best possible matching j , knocking other matchings in process.

This matching is best for proposer i while worst for proposee j .

```

int adj[1020][1020]; int rnk[1020][1020]; // adj[i][r] -> j
// rnk[j][i] -> r
int ptr[1020]; int res[1020]; // ptr[i] = r // res[j] = i
bool f(int i, int j){
    if (res[j] == 0){ res[j] = i; return 1; }
    int p = res[j]; if (rnk[j][p] > rnk[j][i]){
        res[j] = i; ptr[p] += 1; for (int& r = ptr[p]; ; r++){
            if (f(p, adj[p][r])){ break; }
        } return 1;
    } return 0;
}

```

```

for (int i = 1; i <= n; i++){ ptr[i] = 1; }
for (int i = 1; i <= n; i++){
    for (int& r = ptr[i]; ; r++){
        if (f(i, adj[i][r])){ break; }
    }
}

```

7.9 • Hungarian Algorithm

```

// Max version. for Min, adj[v][w] *= -1, then print -ans.

}

```

8 Graph Theory - Miscellaneous

8.1 • Eulerian Path

Directed version. For undirected use $e_i = (v_i, w_i)$ and save i like BCC.

```
vector<int> adj[200020]; int ptr[200020];
int pth[200020]; int len;
void dfs(int now){
    pth[++len] = now;
    for (int& p = ptr[now]; p < adj[now].size();){
        int nxt = adj[now][p++];
        dfs(nxt);
    }
}
```

8.2 • Tree Isomorphism

```
int dep[2][100020]; vector<int> vtx[2][100020]; int
par[2][100020];
int dfs(int t, int v, int p){
    dep[t][v] = dep[t][p]+1; vtx[t][dep[t][v]].push_back(v);
    par[t][v] = p; erase(adj[t][v], p);
    int res = dep[t][v]; for (int w : adj[t][v]){
        if (w == p){ continue; }
        res = max(res, dfs(t, w, v));
    } return res;
}
```

```
int val[2][100020]; int ans[100020];
using pvi = pair<vector<int>, int>;
```

```
centroid(0, 1); pi2 c0 = cent; centroid(1, 1); pi2 c1 = cent;
if ((c0.sc == -1) != (c1.sc == -1)){ cout << "EI"; return; }
for (int t = 0; t < 2; t++){
    pi2& c = (t==0 ? c0 : c1); if (c.sc == -1){ continue; }
    int v = c.fr, w = c.sc; erase(adj[t][v], w);
    erase(adj[t][w], v);
    adj[t][v].push_back(n+1); adj[t][w].push_back(n+1);
    adj[t][n+1].push_back(v); adj[t][n+1].push_back(w);
    c = {n+1, 0};
}
```

```
int d0 = dfs(0, c0.fr, c0.fr); int d1 = dfs(1, c1.fr, c1.fr);
if (d0 != d1){ cout << "EI"; return; }
for (int d = d0; d > 1; d--){
    vector<pvi> res[2];
    for (int t = 0; t < 2; t++){
        for (int v : vtx[t][d-1]){
            res[t].emplace_back(); res[t].back().sc = v;
            for (int w : adj[t][v]){
                res[t].back().fr.push_back(val[t][w]); }
        } for (pvi& p : res[t]){ sort(p.fr.begin(), p.fr.end()); }
        sort(res[t].begin(), res[t].end());
    }
    int l0 = res[0].size(), l1 = res[1].size(); if (l0 != l1){
        cout << "EI"; return; }
    int num = 0; for (int i = 0; i < l0; i++){
        if (res[0][i].fr != res[1][i].fr){ cout << "EI"; return; }
        if (i > 0 && res[0][i-1].fr != res[0][i].fr){ num += 1; }
```

```
int v0 = res[0][i].sc, v1 = res[1][i].sc;
val[0][v0] = val[1][v1] = num;
}
}
queue<pi2> q; q.push({c0.fr, c1.fr}); while (!q.empty()){
    int r0 = q.front().fr, r1 = q.front().sc; q.pop(); ans[r0]
    = r1;
    sort(adj[0][r0].begin(), adj[0][r0].end(), [](int v1, int
    v2){ return val[0][v1] < val[0][v2]; });
    sort(adj[1][r1].begin(), adj[1][r1].end(), [](int v1, int
    v2){ return val[1][v1] < val[1][v2]; });
    int l = adj[0][r0].size(); for (int i = 0; i < l; i++){
        q.push({adj[0][r0][i], adj[1][r1][i]}); }
}
cout << "JAH" << endl; for (int i = 1; i <= n; i++){ cout <<
ans[i]-1 << endl; }
```

8.3 • Graph Realization Problem

Simple Undirected Graph with Degree Sequence $d_1 \geq d_2 \geq \dots \geq d_n$ exists iff $\sum_i d_i$ is even and $\sum_{i=1}^k d_i \leq k(k-1) + \sum_{i=k+1}^n \min(d_i, k)$ holds for every $1 \leq k \leq n$.

You can construct the graph by picking d_1 and connecting it to $2, 3, \dots, d_{d_1+1}$ and pass everything else as induction. Note that $d_2, d_3, \dots, d_{d_1+1}$ also decreases by 1 by doing this, and thus might need reordering.

Simple Directed Graph with In/Outdegree Sequence $(a_1, b_1), (a_2, b_2), \dots, (a_n, b_n)$ with a being nonincreasing exists iff $\sum_i a_i = \sum_i b_i$ and $\sum_{i=1}^k a_i \leq \sum_{i=1}^k \min(b_i, k-1) + \sum_{i=k+1}^n \min(b_i, k)$.

You can construct the graph by picking max b_i and connecting it to vertices with max a_j s.

Simple Bipartite Graph with Degree sequence $a_1 \geq a_2 \geq \dots \geq a_n$ and $b_1 \geq b_2 \geq \dots \geq b_m$ exists iff $\sum_i a_i = \sum_j b_j$ and $\sum_{i=1}^k \min(a_i, k) \leq \sum_{j=1}^m \min(b_j, k)$ for all $1 \leq k \leq n$.

You can construct the graph by greedily matching a_i with max b_j s, for i in 1 to n .

8.4 • Number of Spanning Trees

Let $c_{i,j}$ be the number of edges. Let $M_{i,j}$ be $-c_{i,j}$ if $i \neq j$, and $\deg_i$ otherwise. Then the number of spanning trees of the graph is the any cofactor of M .

For directed spanning tree, $c_{i,j} = (i \rightarrow j)$ and $c_{i,i} = \text{indeg}_i$. The number of spanning trees are the cofactor of (r, r) .

9 Dynamic Programming

Monge (intersection is better than containment): CHT, DnC opt, WQS, MonoQ, Knuth.

9.1 • Rerooting

Tree DP, with changing root. For all direction: Edge $v \rightarrow w$, set root as v and record subtree w .

```
Time Complexity:  $\mathcal{O}(N)$ .
void reroot(int now, int pre){
    ans[now] = dp[now]; for (int nxt : adj[now]){
        if (nxt == pre){ continue; }
        int dpv = dp[now], dpw = dp[nxt];
        dp[now] -= (dp[nxt]?); dp[nxt] += (dp[now]?);
        reroot(nxt, now);
        dp[now] = dpv; dp[nxt] = dpw;
    }
} // dpf(root, root); reroot(root, root)
```

9.2 • Sum over Subset

$$D_S = \sum_{T \subseteq S} A_T.$$

Time Complexity: $\mathcal{O}(N2^N)$.

```
for (int i = 0; i < X; i++){ dp[i] = arr[i]; }
for (int b = 0; b < B; b++){
    for (int bit = 0; bit < X; bit++){
        if (bit >> b & 1){ dp[bit] += dp[bit ^ 1 << b]; }
    }
}
```

9.3 • Convex Hull Trick

$$D_i = \max_{j < i} a_j x_i + b_j.$$

Time Complexity: $\mathcal{O}(N)$ for N insertions, $\mathcal{O}(\log N)$ for query.

```
inline ld crs(pl2 l1, pl2 l2){ return
(ld)(l2.sc-l1.sc)/(l1.fr-l2.fr); }
pair<pl2, ld> stk[100020]; int sp = 0;
inline void psh(pl2 p){
    stk[sp].fr = p; stk[sp].sc = (sp==0 ? 0 : crs(stk[sp-1].fr,
    stk[sp].fr));
    sp += 1;
}
inline void pop(){ sp -= 1; }
```

```
// query: x
int st = 0, ed = sp; while (st+1 <= ed-1){
    int mid = st+ed >> 1;
    if (x < stk[mid].sc){ ed = mid; } else{ st = mid; }
} pl2 p = stk[st].fr; // A(j)x + B(j)
dp[i] = p.fr*x + p.sc + C(i);
// update: p = (A(j), B(j))
while (sp > 0){
    if (crs(stk[sp-1].fr, p) <= stk[sp-1].sc){ pop(); } else{
        break; }
} psh(p);
```

9.4 • Divide and Conquer Optimization

$$D_{k,i} = \max_{j < i} D_{k-1,j} + A_{j,i}. D_{k,N} \text{ must be convex.}$$

Time Complexity: $\mathcal{O}(KN \log N)$.

```
ll dp[2][N+20]; // Sliding Window on first index
void dnc_opt(ll* dp1, ll* dp0, int is, int ie, int os, int
oe){
    if (is > ie){ return; } int im = is+ie >> 1;
    int o = os; for (int p = os; p <= min(oe, im-1); p++){
        if (f(dp0, p, im) < f(dp0, o, im)){ o = p; }
    } dp1[im] = f(dp0, o, im);
    dnc_opt(dp1, dp0, is, im-1, os, o); dnc_opt(dp1, dp0, im+1,
    ie, o, oe);
}
```

9.5 • WQS Binary Search (Aliens Trick)

$$D_{k,i} = \min_{j < i} D_{k-1,j} + A_{j,i}. D_{k,N} \text{ must be convex.}$$

Time Complexity: $\mathcal{O}(T(N) \log X)$.

```
// solve(n, mid) returns the number of used elements
// Binary Search over Lambda
ll st = 0, ed = 1e18; ll ans = 1e18;
while (st <= ed){
    ll mid = st+ed >> 1;
    int cnt = solve(n, mid); ans = min<i128>(ans, dp[n] +
    (i128)mid*k);
    if (cnt <= k){ ed = mid-1; } else{ st = mid+1; }
} cout << ans;
```

9.6 • Monotone Queue Optimization

$D_i = \min_{j < i} D_j + A_{j,i}$. For all pair $i < j$, there exists a unique point p that $D_i + C_{i,p}$ and $D_j + C_{j,p}$ changes. So $k < p$ means $<$, and $\geq$ otherwise.

Time Complexity: $\mathcal{O}(N \log N)$.

Code from *BOJ 17439 - Flower Shop*.

```
ll arr[50020]; ll prf[50020];
```

```
deque<int> dq;
p12 dp[50020];
inline ll f(int j, int i){ return (prf[i]-prf[j])*(i-j); }
inline ll dpf(int j, int i){ return dp[j].fr + f(j, i); }
inline int crx(int a, int b, int n){ // Assume a < b.
    int st = b+1, ed = n; int i = n+1; while (st <= ed){
        int mid = st+ed >> 1;
        if (dpf(a, mid) >= dpf(b, mid)){ i = mid; ed = mid-1; }
        else{ st = mid+1; }
    } return i;
}
int solve(int n, ll x){
    dp[0] = {0, 0}; for (int i = 1; i <= n; i++){
        while (dq.size() >= 2){
            int dql = dq.size();
            int a = dq[dql-2], b = dq[dql-1];
            if (crx(a, b, n) >= crx(b, i-1, n)){ dq.pop_back(); }
            else{ break; }
        } dq.push_back(i-1);
        while (dq.size() >= 2){
            int a = dq[0], b = dq[1];
            if (crx(a, b, n) <= i){ dq.pop_front(); }
            else{ break; }
        } int j = dq.front();
        dp[i] = {dpf(j, i), dp[j].sc+1};
        //cout << dp[i].fr << " \n"[i==n];
    } return dp[n].sc;
}
```

9.7 • Slope Trick

Let f be a convex piecewise linear function with integer coefficient. We can save this function by the points where the line changes, with one linear function.

We can add two functions by merging the points without removing duplicants, and adding the linear function. Use `priority_queue` if needed.

9.8 • Knuth Optimization

$D_{i,j} = D_{i,k} + D_{k+1,j} + A_{i,j}$ where $\text{opt}_{i,j-1} \leq \text{opt}_{i,j} \leq \text{opt}_{i+1,j}$.

Time Complexity: $\mathcal{O}(N^2)$.

```
for (int d = 0; d < n; d++){
    for (int s=1, e=1+d; e <= n; s++, e++){
        if (d == 0){ dp[s][e] = 0; opt[s][e] = s; }
        else{
            opt[s][e] = s; dp[s][e] = INF;
            for (int p = opt[s][e-1]; p <= opt[s+1][e]; p++){
                ll res = dp[s][p] + dp[p+1][e] + prf[e]-prf[s-1];
                if (dp[s][e] > res){ dp[s][e] = res; opt[s][e] = p; }
            }
        }
    }
}
```

```
}
} cout << dp[1][n] << endl;
```

9.9 • Kitamasa

$A_n = \prod_{i=1}^k A_{n-d} C_d$. The code below uses `arr` as initial terms with index 0 to $n-1$. And `f` as coefficient of $x^n - \sum_{d=1}^k C_d x^{n-d}$.

```
const ll mod = 104857601; const ll r = 3;

ll fpow(ll mul, ll bit){
    ll res = 1; while (bit){
        if (bit&1){ res = res*mul % mod; }
        mul = mul*mul % mod; bit >>= 1;
    } return res;
} inline ll finv(ll x){ return fpow(x, mod-2); }

9.10 • Hirschberg

Unlike other string algorithms, this assumes that `s1` and `s2` is 1-indexed.

string `s1`, `s2`;

```
int dp[3][7010];
void solve(int i1, int j1, int i2, int j2, bool top = true){
    if (i1 > j1 || i2 > j2){ return; }
```

```

if (i1 == j1){
    for (int p2 = i2; p2 <= j2; p2++){
        if (s1[i1] == s2[p2]){
            if (top){ cout << 1 << endl; }
            cout << s1[j1] << ENDL; return;
        }
    }
    if (top){ cout << 0 << endl; } return;
}
int m1 = i1+j1 >> 1;
for (int p1 = i1-1; p1 <= m1; p1++){
    int b1 = p1&1; int b0 = 1-b1;
    for (int p2 = i2-1; p2 <= j2; p2++){
        if (p1 == i1-1 || p2 == i2-1){ dp[b1][p2] = 0; }
        else{
            dp[b1][p2] = max(dp[b0][p2], dp[b1][p2-1]);
            if (s1[p1] == s2[p2]){ dp[b1][p2] = max(dp[b1][p2],
                dp[b0][p2-1+1]); }
        }
    }
}
if ((m1&1) == 0){

connected.

```

9.12 • Permutation DP

Let $D_{i,j}$ be the number of pre-permutations that uses the value from 1 to i , and has j components. The transition is to:

- Create new component: $(i, j) \rightarrow (i+1, j+1)$.
- Append $i+1$ to one of the component: $(i, j) \rightarrow (i+1, j)$.
- Connect two components using $i+1$: $(i, j) \rightarrow (i+1, j-1)$.

When the starting/ending point is specified, you need to be careful about the number of *open-ended* points.

```

11.7 • Centroid Tree

Repeatedly apply centroid to the subtrees, and make the tree. The height of the centroid tree is at most $\lceil \log_2 N \rceil + 1$.

Also, the path $v \Rightarrow w$ from original tree always pass through LCA of v and w in centroid tree.

```

vector<int> tree[100020]; int par[100020];
int dfs(int v){
    centroid(v); v = cent.fr; chk[v] = 1;
    for (pi2 e : adj[v]){
        int w = e.fr; if (chk[w]){ continue; }
        int p = dfs(w); tree[v].push_back(p); par[p] = v;
    }
}

```

```

    } return v;
}

```

11.8 • Permutation Tree

upd and qry is range add update and range min query, using Lazy-Seg.

```

for (int i = 1; i <= n; i++){ val[i] = {arr[i], arr[i]};

    chl[v][0] before query
}

```

12.3 • Centroid Decomposition

Time Complexity: $\mathcal{O}(N \log N)$.

```

bool chk[100020]; int siz[100020];
void sizf(int v, int p){
    siz[v] = 1; for (pi2 e : adj[v]){
        int w = e.fr; if (chk[w]){ continue; } if (w == p){
            continue; }
        sizf(w, v); siz[v] += siz[w];
    }
}
pi2 cent = {-1, -1}; void centroid(int v, int p, int n){
    bool flg = 1; for (pi2 e : adj[v]){
        int w = e.fr; if (chk[w]){ continue; } if (w == p){
            continue; }
        centroid(w, v, n); if (siz[w]*2 > n){ flg = 0; }
    } if (flg && (n-siz[v])*2 <= n){ (cent.fr == -1 ? cent.fr :
cent.sc) = v; }
} inline void centroid(int v){ cent = {-1, -1}; sizf(v, v);
centroid(v, v, siz[v]); }

```

```

ll dnc(int v){
    centroid(v); v = cent.fr;
    // solve on path that passes v. divide it by subtree, and
    merge subtree-wise. use top-down.
    chk[v] = 1; for (pi2 e : adj[v]){
        int w = e.fr; if (chk[w]){ continue; }
        ans += dnc(w);
    } return ans;
}

```

12.4 • Tree Compression

Time Complexity: $\mathcal{O}(K \log N)$ per query.

```

vector<int> arr;
for (int i = 1; i <= n; i++){ int v; cin >> v;
arr.push_back(v); }
sort(arr.begin(), arr.end(), [](int v, int w){ return ord[v]
< ord[w]; });
for (int i = 1; i < n; i++){
    int v = arr[i-1], w = arr[i]; arr.push_back(lca(v, w));
} sort(arr.begin(), arr.end(), [](int v, int w){ return
ord[v] < ord[w]; });
arr.erase(unique(arr.begin(), arr.end()), arr.end());
int al = arr.size(); for (int i = 1; i < al; i++){
    ll l = lca(arr[i-1], arr[i]);
    adj[cvt(arr, l)].push_back({i, dis[arr[i]]-dis[l]});
    adj[i].push_back({cvt(arr, l), dis[arr[i]]-dis[l]});
}

```

12.5 • Parallel Binary Search

Time Complexity: $\mathcal{O}(Q \log X)$.

```

// Binary Search: path available after ans-th event.
// 0-th event: impossible as nothing is active
// m-th event: possible as everything is connected
struct Query{ int st, ed; int idx; int v, w; };
Query qrr[100020];
while (1){
    sort(qrr+1, qrr+q+1, [](Query& q1, Query& q2){
        return (q1.st+q1.ed)/2 < (q2.st+q2.ed)/2;
    });
    for (int i = 1; i <= n; i++){ par[i] = -1; }

arr[ptr].dp); ptr += 1; }
            else{ break; }
        } arr[i].dp = max(arr[i].dp, qry(1, arr[i].c)+1);
    } for (int i = st; i <= mid; i++){ upd(arr[i].c, 0); }
    return dnc(mid+1, ed);
}

```

13 Greedy

13.1 • Job Scheduling w/ Deadline & Duration

```

p12 arr[250020]; // {deadline, duration}
sort(arr+1, arr+n+1, [](p12 p1, p12 p2){ return p1.fr >
p2.fr; });
priority_stack<ll> pq; int ans = 0;
int i = 1; while (i <= n){
    int j = i; while (j <= n){
        if (arr[i].fr == arr[j].fr){ j += 1; } else{ break; }
    }
    for (int p = i; p < j; p++){ pq.push(arr[p].sc); }
    ll tim = arr[i].fr - arr[j].fr; while (tim > 0){
        if (pq.empty()){ break; } ll t = pq.top(); pq.pop();
        ll d = min(t, tim); if (t-d == 0){ tim -= d; ans += 1; }
        else{ tim -= d; t -= d; pq.push(t); }
    } i = j;
} cout << ans;

```

13.2 • Bounded Scheduling

If $x \geq B_i$, then $x \leftarrow x + A_i$. $B_i + A_i \geq 0$.

```

p12 arr[100020]; // (A[i], B[i])
sort(arr+1, arr+n+1, [](p12 p1, p12 p2){
    ll a1 = p1.fr, b1 = p1.sc;
    ll a2 = p2.fr, b2 = p2.sc;
    if ((a1 >= 0) != (a2 >= 0)){ return (a1 >= 0) > (a2 >= 0); }
    if (a1 >= 0){ return b1 < b2; } else{ return a1+b1 > a2+b2; }
});
ll x = 0; for (int i = 1; i <= n; i++){
    if (x < arr[i].sc){ /* Impossible; Quit */ }
    x += arr[i].fr;
} /* Possible */

```

14 Heuristics

Let the candidate be S , and f be the scoring function. Lower score is better. Hyperparameter can be changed based on the problem.

It is strictly recommended to return the global minimum, rather than the final result. If possible, alter the score rather than completely recalculate it.

14.1 • Simulated Annealing

Hyperparameter: $d = 0.9999$ (higher = faster cooling), $k = 10$ (higher = more volatile)

1. Set $t = 1$ and generate random answer S , and compute the score $F = f(S)$.
2. Repeat the following:
 - (a) Randomly change the answer S to generate S' .
 - (b) Compute $p = e^{(f(S)-f(S'))/kt}$.
 - (c) Change the answer to S' with probability $\min(p, 1)$.

14.2 • Diversified Late Acceptance Search

Hyperparameter: $l = 5$ (higher = longer memory)

1. Generate random answer S , and compute the score $F = f(S)$.
2. Set $P_i = F$ for all $1 \leq i \leq l$. Set $k = 0$.
3. Repeat the following:
 - (a) Set $F_* = F$ and generate S' , and compute $F' = f(S')$.
 - (b) If $F' = F$ or $F' < \max P$, change the answer (and score) to S' (and F').
 - (c) If $F > P_k$ or $(F < P_i \text{ and } F < F_*)$, set $P_i = F$.
 - (d) Set $k = (k+1) \bmod l$.

15 Code Snippet - C++

15.1 • Default Setting

```
#include <bits/stdc++.h>
#define endl '\n'
const int PRECISION = 0;
using namespace std;

void Main(){

}

int main(){
    ios_base::sync_with_stdio(0); cin.tie(0); cout.tie(0);
    cout.setf(ios::fixed); cout.precision(PRECISION); Main();
}
```

15.2 • Line Input

```
inline void icl(istream& in){ in.ignore(998244353, '\n'); }
```

// Between cin and getline

```
string s; getline(cin, s); // No newline at the end
```

15.3 • Floor/Ceil a Fraction

```
inline ll fffloor(ll a, ll b){
    if (b < 0){ a = -a; b = -b; }
    return (a >= 0 ? a/b : (-a+b-1)/b*-1);
}

inline ll fceil(ll a, ll b){
    if (b < 0){ a = -a; b = -b; }
    return (a >= 0 ? (a+b-1)/b : -a/b*-1);
}
```

15.4 • Vector Manipulation

```
template <typename T> inline void unq(vector<T>& v){
    sort(v.begin(), v.end()); v.erase(unique(v.begin(),
        v.end()), v.end());
}

template <typename T> inline int cvt(vector<T>& v, T x){
    return lower_bound(v.begin(), v.end(), x) - v.begin();
}

template <typename T> inline void erase(vector<T>& v, const
T& x){
    v.erase(remove(v.begin(), v.end(), x), v.end());
} // removes every x in v
```

15.5 • Bitwise Function

```
inline int bit1(int x){ return __builtin_popcount(x); } // #
of 1
inline int bit2(int x){ return x==0 ? 32 : __builtin_ctz(x);
} // max k s.t. n | 2^k
inline int bitl(int x){ return x==0 ? 0 : 32 -
__builtin_clz(x); } // # of bits
inline int bith(int x){ return x==0 ? 0 : 1 << bitl(x)-1; }
// max 2^k s.t. 2^k <= n
inline int bitp(int x){
    int y = bith(x); return x==0 ? 0 : y << (x!=y);
} // min 2^k s.t. n <= 2^k
```

15.6 • Randomization

```
const time_t TIME =
chrono::high_resolution_clock::now().time_since_epoch().count();
mt19937 gen(TIME);
uniform_int_distribution<int> rng(a, b); // [a, b] range
int value = rng(gen); shuffle(begin, end, gen);
```

15.7 • Custom Hash

```
struct custom_hash {
    static uint64_t splitmix64(uint64_t x) {
        x += 0x9e3779b97f4a7c15;
        x = (x ^ (x >> 30)) * 0xbf58476d1ce4e5b9;
        x = (x ^ (x >> 27)) * 0x94d049bb133111eb;
        return x ^ (x >> 31);
    }

    size_t operator()(uint64_t x) const {
        static const uint64_t FIXED_RANDOM =
            chrono::steady_clock::now().time_since_epoch().count();
        return splitmix64(x + FIXED_RANDOM);
    }
};
```

```
unordered_map<ll, int, custom_hash> mp;
```

15.8 • Policy Based Data Structure

```
#include <ext/pb_ds/tree_policy.hpp>
#include <ext/pb_ds/assoc_container.hpp>
using namespace __gnu_pbds;
template <typename T> using ordered_set = tree<T, null_type,
less<T>, rb_tree_tag, tree_order_statistics_node_update>;
template <typename K, typename V> using ordered_map = tree<K,
V, less<K>, rb_tree_tag, tree_order_statistics_node_update>;
```

```
ordered_set<int> s; s.insert(value);
s.find_by_order(index); // 0-based, returns iterator
s.order_of_key(value); // 0-based, lower_bound
```

```
ordered_map<int, int> mp;
mp.insert({1, 4}); mp[4] = 7;
mp.find_by_order(1)->first // key, 4
mp.find_by_order(1)->second // value, 7
```

15.9 • Custom Comparison

```
bool cmp(int a, int b){ return a < b; }
sort(begin, end, cmp); // a -> b
set<int, decltype(&cmp)> s(cmp); // a -> b (inorder)
```

```
priority_queue<int, vector<int>, decltype(&cmp)> pq(cmp); //
b on top
```

```
sort(v.begin(), v.end(), [](pi2 a, pi2 b){ return a.fr+a.sc <
b.fr+b.sc; });
auto st = lower_bound(v.begin(), v.end(), x, [](pi2 p, int
x){ return p.fr+p.sc < x; });
auto ed = upper_bound(v.begin(), v.end(), x, [](int x, pi2
p){ return x < p.fr+p.sc; });
// [st, ed) is where p.fr+p.sc == x
```

```
struct cmp{
    bool operator()(const pi2& p1, const pi2& p2){ return
        p1.fr+p1.sc < p2.fr+p2.sc; }
};
tree<pi2, null_type, cmp, rb_tree_tag,
tree_order_statistics_node_update> s;
```

15.10 • Dynamic Bitset

```
const int MAX = 200000;
template <int N = 1> void solve(int n){
    if (N < n){ return solve<min(N*2, MAX)>(n); }
}
```

16 Code Snippet - Python

16.1 • Default Setting

```
import sys; input = lambda: sys.stdin.readline().rstrip('\n')
inputs = lambda t, l=tuple: l(map(t, input().split()))
sys.setrecursionlimit(100000)
```

16.2 • List Manipulation

```
l.reverse(); l = list(reversed(l))
l.sort(); l = sorted(l)
```

16.3 • Arbitrary Precision

```
from fractions import * # Fraction, no limit
x = Fraction(10)
```

```
from decimal import * # Decimal, limited
getcontext().prec = 28 # Number of precision = digits
x = Decimal(20)
```

16.4 • Data Structure

```
from collections import deque
q = deque() # Deque
q.append(x); q.appendleft(x)
x = q.pop(); x = q.popleft()
```

```
import heapq # Heap
```

```
pq = []
heapq.heappush(pq) # push
x = heapq.heappop(pq) # pop
```

16.5 • Custom Hashing

```
import time; TIME = int(time.time() * 1000)
dict[(x, TIME)] # anti-hash
```

16.6 • Custom Comparison

```
from functools import cmp_to_key
def cmp(a, b): return sgn(a-b) # a < b then -, a > b then +,
otherwise 0
l.sort(key=cmp_to_key(cmp)); sorted(l, key=cmp_to_key(cmp))
```

17 Miscellaneous

17.1 List of Primes

- $\leq 10^3$: 168 primes, max 997.
